Introduction

In 2010, Congress enacted the Patient Protection and Affordable Care Act that requires non-profit hospitals to conduct a community health needs assessment and adopt an implementation strategy every three years. In alignment with that commitment, Houston Methodist conducted a Community Health Needs Assessment for each of the surrounding communities of its eight hospitals. The large scale assessment included a health survey of 1,000 individuals from around the Greater Houston community, the analysis of publicly available data on health and health outcomes, and a series of interviews with community leaders, public health experts and citizens regarding perceived health and healthcare needs in our community. Through the assessment process Houston Methodist has defined the following priorities as:

- **Primary Care Services:** Increase access to primary care services for the surrounding community.
- **Specialty Care Services:** Reduce barriers to accessing specialty care services for the surrounding underserved community.
- **Mental Health Care Services:** Increase access to mental health care services within the surrounding underserved community.
- **Healthy Living Behaviors:** Promote healthy living behaviors that reduce the likelihood of chronic disease development.

In this Community Health Needs Assessment (CHNA), the report will focus on the geographic areas Houston Methodist Sugar Land primarily serves and will touch on social and health topics that can significantly impact the status of a healthy community. The report will provide a foundation for the Hospital’s efforts to guide community benefit planning to improve the health status of the supported community, will serve as the basis for implementation plan development for 2016-2019 and compliments the State of Texas requirements on community benefit reporting for nonprofit hospitals.
Houston Methodist Profile:

Houston Methodist Sugar Land (HMSL), located in Fort Bend County within the Greater Houston area, is owned and operated by Houston Methodist, a not-for-profit health care system.

In addition to HMSL, Houston Methodist comprises an innovative Research Institute, an internationally focused Global Health Care Services entity, a strong Physicians Organization and 6 other community hospitals in addition to the flagship hospital, Houston Methodist Hospital, located in the Texas Medical Center. Aligned with the quality standards of Houston Methodist facilities, HMSL has received numerous accolades which include but are not limited to U.S. News & World Report’s Best Metro-Area Hospital, along with numerous accreditations such as American College of Surgeons Commission on Cancer Accreditation and Pathway to Excellence Designation for commitment to nurse satisfaction, excellent bedside care and patient safety — an award given annually by the American Nurses Credentialing Center.

**HMSL Mission Statement:**
To provide high quality, cost effective health care that provides for the comfort of our patients, and delivers the best value to the community and people we serve in a spiritual environment of caring.

**Our Values: (ICARE)**

- **Integrity:**
  We are honest and ethical in all we say and do.

- **Compassion**
  We embrace the whole person and respond to emotional, ethical and spiritual concerns as well as physical needs.

- **Accountability:**
  We hold ourselves accountable for our actions.

- **Respect**
  We treat every individual as a person of worth, dignity and value.

- **Excellence**
  We strive to be the best at what we do and a model for others to emulate.

Defining the Houston Methodist Sugar Land Community

Approximately 26.9 million people live in Texas, with 8% residing in the city of Houston alone. The fourth most populous city in the United States behind New York, Los Angeles, and Chicago, Houston was ranked as Forbes Fastest Growing City in 2015. Currently, eleven health service regions divide the state. Houston Methodist serves communities residing in region 6/5 South.

Houston Methodist Sugar Land (HMSL) defines the Houston-Sugarland-Baytown metropolitan statistical area (MSA) as its community. HMSL primarily serves the counties of Fort Bend, Harris, Brazoria and Wharton though the full list of counties which fall into the specified MSA include: Montgomery, Galveston, Liberty, Chambers, and Waller. The total MSA population with all counties considered increased by 9.1% between 2010 and 2014, equating to an addition of 541,105 residents. Based on the total population in comparison to all 917 metro areas in the nation, the Houston-Sugarland-Baytown MSA was ranked 6th largest in 2010 and 5th largest in 2014. Annual net migration to the MSA was 88,657 residents in 2013 and 98,133 residents in 2014. Figure 1 below displays the current geographic footprint of the MSA that HMSL is located in. For the purposes of this report, the assessment will zero in primarily on Fort Bend County as it is the largest county that is primarily served by HMSL though mention will be periodically made throughout on the additional counties pertaining to the service area.

For this report, references to the MSA will include all nine counties. References to “community or HMSL community” will be in reference to the two largest counties that are primarily served by that hospital (Fort Bend and Harris). Periodic specific references will be made to the smaller counties that are served on a smaller scale by HMSL (Wharton and Brazoria).

Data Source: 2015 HM Market Analysis (Houston Methodist MSA)
Population Size:
The Houston Methodist Sugar Land community in reference to the primary counties served (Fort Bend, Wharton, Harris and Brazoria) spans approximately 5,009 square miles and contains an estimated population of 5,486,294 residents. The overall MSA accounts for approximately 6,491,870 people. With respects to Harris County being the largest in Texas and the largest county in the MSA in which HMSL is located, Harris accounts for an estimated 4.5 million community members, equating to approximately 68% of the MSA. In regards to the primary county served by HMSL, Fort Bend has an estimated population of 633,069. The MSA significantly expanded between years 2000 and 2010.

Fort Bend County experienced the most population growth within the MSA counties between 2010 and 2015 at a rate of 16%. Between 2015 and 2020, Fort Bend is expected to experience an 11% population increase. The Houston-Sugarland-Baytown MSA is expected to increase by 8% between 2015 and 2020. Wharton County experienced the least amount of population growth within the MSA counties between 2010 and 2015 at 1%. Wharton County is expected to have the lowest population growth in comparison to the other MSA counties between 2015 and 2020. See Table 1 for a breakdown of population by counties via the designated MSA for a comparison.

Data Source: 2015 Houston Methodist Market Analysis

Race/Ethnicity:
The Houston Methodist Sugar Land metropolitan-statistical-area is considered one of the most diverse in the nation, with Fort Bend County being designated as the most ethnically diverse reflecting an equal distribution of the nation’s major ethnic races. For the purposes of this report, Black includes the population of African descent/non-Latino. White includes European descent/non-Latino. The category of other encompasses the ethnic populations including but not limited to Asian descent, Middle Eastern descent and Mixed Race. Please see Table 2 and 3 for a breakdown of the racial populations by the counties primarily served by HMSL, Harris and Fort Bend.
The entire MSA serves an incredibly dynamic and diverse community and lacks a singular racial majority and every race currently occupies a minority position. The Asian population experienced the most growth in the MSA (19%) between 2010 and 2015. The Hispanic population in Fort Bend County increased by 13% between 2010 and 2015, and is expected to increase by 12% between 2015 and 2020. The Anglo population increased the least in the past five years in comparison to other racial groups, and is expected to maintain the lowest rate of increase by 2020. The Black population increased by 9%.
Age and Gender:
Three major age groups make up the Houston Methodist Sugar Land community. They are 1) the youth, adolescent, and young adult population; 2) the adult population; and 3) the senior population.

The Youth and Adolescent Population
The Youth and Adolescent population is defined as any person between the ages of 0 – 17 years. The youth and adolescent population accounts for the second highest percentage of the MSA (27%). Comparatively, this age group accounts for 27.9% of Fort Bend County’s population. There is low percentage variability between the age groups included in this population.

The Adult Population
The Adult population is defined as any person between the ages of 18 – 64 years. The adult population accounts for the highest percentage of the MSA (63%). The overall adult population is expected to grow 12% by 2020. Harris County, one of the counties served by HMSL, shows an adult population of 63.7%. Fort Bend County’s adult population accounts for 62.7%. Again, the primarily served county of Fort Bend closely aligns with the overall age group’s population in the designated MSA. MSA projections to 2020 estimate the adult population to remain the most significant portion of the Greater Houston community.

The Senior Population
The Senior population is defined as any person over the age of 65 years. The senior population currently accounts for 10% of the MSA. While it accounts for the lowest percentage of the community, the senior population projects the highest percent growth of any cohort by 2020 (30%). Growth trends within the senior population reflect the aging of the MSA. Specifically, in Fort Bend County, the senior population accounts for 9.4% of the prevalently served HMSL community. Wharton County’s senior population accounts for 15.8% which is significantly higher than the overall MSA as well as the most served county, Fort Bend. Brazoria County’s senior population is 10.9% and Harris County’s senior population makes up 9.25% of the overall population. See Table 5 for a breakdown of the MSA by age.

**Household Income and Poverty:**

The MSA as a whole has experienced an expansion in average household income dating back to 2000. This increase also projects to continue into 2020 for nearly all MSA counties. In 2014, the average household income in Harris County was $54,230. Fort Bend County currently has the highest average household income at $88,516. Wharton County currently has the lowest average household income at $44,110. See Table 7 for income comparisons by MSA counties.

**Data Source: Texas Association of Counties**
In the United States, the set minimum amount of gross income that a family needs for food, clothing, transportation, shelter and other necessities is determined by the Department of Health and Human Services. This is referred to as the Federal Poverty Level, or FPL. FPL varies according to family size. The number is adjusted for inflation and reported annually in the form of poverty guidelines. Those living on less than the amount for a specified family size are considered to be living under 100% of the FPL. The chart to the right shows the current amounts utilized to determine FPL threshold. A family living on the listed amounts in correlation to family size is considered to be impoverished.\

Each county within the MSA experiences a varying degree of poverty. On average, the poverty rate for the designated MSA counties (16.3%) is lower than the poverty rate for the state of Texas (17.5%). This equates to approximately 1.01 million people living in poverty in the overall MSA. Harris County has more persons living in poverty at 18.5% than all other counties combined. Fort Bend County has the lowest rate of community members living in poverty at 8.9%.

Disparities of poverty exist across age. 23.3% of children living in the MSA live below the FPL. Harris County has the highest rate of poverty for persons under the age of 18 at 26.7%. Fort Bend County has a 12.2% poverty rate for children under the age of 18.

Table 8

Table 9

Data Source: Families USA

Data Source: Texas Department of State Health Services
**Educational Attainment:**
Educational attainment varies across counties within the MSA. Among the 3,908,384 community members age 25 years of age and older, 18.5% did not graduate high school and 23.5% possess only a high school diploma. See Table 10 for a further breakdown of educational attainment for those 25 years and older in the MSA. Fort Bend County has the highest percentage of community members who possess a graduate or professional degree (14%) compared to the other counties in the MSA. It is important to note that Fort Bend County also has the highest household income average. Wharton County has the highest percentage of members who did not receive a high school diploma (25%), as well as the lowest household income average.iii

*Data Source: American Community Survey 2014*
**Language:**
The designated MSA is one of the most linguistically diverse in the United States, with 37.8% of community members utilizing a dominate language other than English. Spanish is the predominate language second to English, with 1.7 million community members (29%) reporting Spanish as their primary primary language. 3.1% of community members speak other Indo-European languages, 4.5% speak Asian and Pacific Islander languages, and 1.1% speak other languages, not identified.  

**Insurance Status:**
With Fort Bend County being the county most served by HMSL, it is important to note the insurance status of this specific population. In 2015, 11% of Fort Bend County and 16% of Harris County members were reported as uninsured. In 2015, approximately 10% of overall community members (all counties that HMSL serves combined), were enrolled in Medicare. With that, 57,838 residents of Fort Bend enrolled in Medicare which accounts for approximately 9% of the estimated Fort Bend population. 494,942 in Harris County enrolled in Medicare. Though only 10% of community members are insured through Medicare, that population is expected to have the largest increase between 2015 and 2020. This directly correlates to the growth expected within the senior population as community members reach Medicare eligibility age. It is important to note Medicare benefits not only seniors age 65 and older but also those with disabilities and end stage disease states. 624,465 people within the MSA were enrolled in Medicaid in 2015. The number of uninsured community members and members insured through Medicaid are expected to decrease between 2015 and 2020, while the number of members privately insured is expected to increase by 9%.

---

![Map showing uninsured rates by county with Fort Bend County marked.](image-url)
Most Common Disease States: Harris and Fort Bend Counties

Harris and Fort Bend counties are the primary counties served by Houston Methodist Sugar Land (HMSL). The following causes of death will pertain primarily to this region in order to provide a snapshot of chronic disease prevalence.

Heart Disease:
Heart disease is one of the leading causes of mortality in Harris and Fort Bend County. In 2013, the mortality rates for heart disease in Harris and Fort Bend County were 120.3 deaths per 100,000 people and 87.3 per 100,000 people, respectively.xiv Fort Bend County has the lowest heart disease mortality rate of all MSA counties. Heart disease is usually caused by a condition called atherosclerosis, caused by plaque build-up in the arteries. This narrows the arteries, decreasing blood flow. This can increase the possibility of a blood clot, which stops the blood flow completely and causes a heart attack. In 2013, 5.6% of the MSA population had been diagnosed with heart disease.xv

Genetic predisposition greatly impacts the development of heart disease, and therefore those with heart disease in their family are more likely to experience heart disease themselves. Preventative measures can be taken to decrease the likelihood of developing heart disease. The American Heart Association’s program, “Life’s Simple 7”, highlights seven key health factors and behaviors to gauge overall heart health. The program’s seven health factors include: not smoking, physical activity, healthy diet, body weight, and control of cholesterol, blood pressure, and blood sugar.xvi Healthcare providers and public health practitioners work diligently to educate patients on these factors with the goal of decreasing their risk for heart disease.xvii

Cancer:
Cancer is one of the leading causes of mortality in Harris and Fort Bend County. Though there are many types of cancers, all cancers are due to abnormal cell growth. Normal cells grow, divide, and then die so that new cells may form. Cancer cells do not die, but rather continue to grow in abnormal ways, often invading other tissues. The spreading of cancer is called metastasis. The different types of cancers are named based on where the cancer cells first originated, such as in the lungs or brain.xviii In 2013, it was estimated that 5,412 Harris County residents died from cancer. Comparatively, 656 Fort Bend County residents died in 2013 from cancer.xix Breast cancer is the most prevalent cancer for women in Houston and prostate cancer is the most prevalent for men, yet more people die from lung cancer than any other cancer.xx The charts to the right show the number of deaths per 100,000 people from the top five cancers in both Harris and Fort Bend County in 2013.xxi

The goal of primary cancer prevention is to keep cancer from developing through living a healthy lifestyle and avoiding cancer causing substances, such as tobacco. Certain risk factors increase the likelihood of cancer development, some of which an individual cannot control. Risk factors include age, family history (genetics), alcohol consumption, obesity, and exposure to elements such as sunlight, tobacco, radiation, and harmful environmental agents.

The goal of secondary cancer prevention is to detect and treat conditions that may become cancer, as well as early cancer with no symptoms.

While the risk of getting cancer could in some situations be lessened by behavioral choices, prevention through screenings and early treatment against pre-cancer and early cancer is crucial to decreasing prevalence and severity of cancers.xxii
**Stroke:**
Stroke is the third leading cause of death in the United States and in Houston. In 2013, 1,486 people died in Harris, Fort Bend, Brazoria, and Wharton counties, combined. Stroke, also known as cerebrovascular disease, occurs when “an artery inside or leading to the brain becomes blocked and cuts off blood flow to part of the brain, or when an artery in the brain leaks or ruptures”. Brain tissue can die when its blood flow is reduced or cut off.

Immediate medical attention is crucial to both survival and minimizing long-term effects. Currently, only 1 in 3 Americans can recognize the signs and symptoms of strokes. Recent public health efforts have aimed to increase recognition of warning signs of stroke. The most well-known initiative is FAST, an acronym that encourages people to take note of FACE, ARMS, SPEECH, and TIME.

There are many measures that can be taken to prevent stroke. In fact, it is estimated that up to 80% of strokes can be prevented. People with atrial fibrillation are at an increased risk for having stroke. People with high blood pressure and/or cholesterol are also at a higher risk for having a stroke. Furthermore, people may adjust their lifestyles to reduce their risk of stroke. Experts recommend more vegetable, whole grain, fish, and nut intake, as well as eating a limited amount of sodium, added sugars, and refined grains. Other lifestyle factors that reduce risk of stroke include physical activity, avoidance of smoking and tobacco use, and limited consumption of alcohol.

**Diabetes:**
Diabetes is the sixth leading cause of death in the United States and in Texas. In 2012, 19,474 (7.1 per 1,000 people) Harris County residents were diagnosed with diabetes. Comparatively, 2,537 (6.4 per 1,000 people) Fort Bend County residents were diagnosed with diabetes in 2012. That same year, a combined 783 people died in Harris and Fort Bend Counties from diabetes.

Diabetes is defined as “a metabolic disease characterized by persistent hyperglycemia or high blood sugar”. There are two kinds of diabetes, Type 1 and Type 2, which are differentiated by both onset and insulin deficiency. The onset of Type 1 usually occurs during adolescence. Type 1 diabetes is characterized by an autoimmune response in the body which renders the pancreas unable to produce insulin. Type 2 diabetes can occur at virtually any time in a person’s life, and is characterized by insulin resistance and also insulin deficiency. Type 2 diabetes is more common than Type 1.

There are many risk factors for both Type 1 and Type 2 diabetes. Risk factors for Type 1 include family history, genetics, and age. Risk factors for Type 2 can be classified into non-modifiable and modifiable.
include family history, age of 45 or older, and race. Modifiable factors include being overweight and having limited physical exercise.

A diagnosis of diabetes can lead to many other medical complications. These complications include heart disease, stroke, high blood pressure, blindness, kidney failure, nervous system damage, amputations, and dental disease.

**Chronic Lower Respiratory Disease:**
Chronic lower respiratory disease refers primarily to Chronic Obstructive Pulmonary Disease (COPD), which is a group of diseases that cause airflow blockage, including emphysema, chronic bronchitis, and asthma, in some cases. COPD makes it difficult to breathe, greatly impacting overall quality of life. Symptoms include a chronic cough, constant shortness of breath, wheezing, and chronic phlegm production. In 2012, approximately 149,358 (3.5%) of Harris County residents had been diagnosed with COPD. In 2012, a total of 6,276 people were hospitalized for COPD in Harris, Fort Bend, Brazoria, and Wharton Counties, combined. Comparatively, 957 residents of Harris County and 95 residents of Fort Bend County died from COPD in 2012. In 2013, 953 and 109 died from COPD in Harris and Fort Bend respectively.

Tobacco is the most common cause of COPD. Exposure to environmental and occupational pollutants such as secondhand smoke, fumes, gases, and dusts, as well as genetic predisposition, also increase one’s risk of COPD. Eliminating tobacco use and exposure to environmental pollutants is necessary for anyone with COPD. A cure is not available for COPD, but the symptoms can be managed through medication, pulmonary rehabilitation, physical activity training, and oxygen treatments. This management can greatly improve overall quality of life for someone with COPD.

**The Affordable Care Act:**
The Affordable Care Act expands health insurance coverage through a system of penalties and incentives. The Affordable Care Act is comprised of 10 “titles” that are each dedicated to a different aspect of the United States healthcare system. Title I of the Affordable Care Act, “Quality Affordable Health Care for All Americans”, outlines health insurance coverage. The basic components related to insurance reform are as follows:

- Individuals cannot be turned down for insurance because of pre-existing conditions
- Everyone must have coverage
- Individuals who cannot afford coverage will receive assistance in paying for it
- Individuals living under 133% of the Federal Poverty Level will be insured through Medicaid, except for states that do not expand Medicaid

Individuals who do not obtain coverage are subject to a penalty unless they meet certain exemptions. The penalties were phased in over a three-year period starting in 2014 and increased substantially in 2016. It has not been determined if the increased penalties will encourage uninsured people to obtain coverage going forward. The table below shows the number of individuals enrolled in the Affordable Care Act Insurance Marketplace as of February 22, 2015.
Other titles of the Affordable Care Act include “Improving Quality and Efficiency of Health Care”, aimed at creating a healthcare system where payments are based on quality of healthcare services delivered, “Prevention of Chronic Disease and Improving Health”, aimed at early prevention and treatment of chronic illnesses to avoid expensive complications, and “Role of Public Programs”, aimed at changing how healthcare is delivered through public programs like Medicaid and the Indian Health Services.\textsuperscript{xxxviii}

The next section will focus on the prioritized needs of Houston Methodist Sugar Land (HMSL). Due to the limitations that can be imposed on individuals regarding access to healthcare service relating to insurance status, HMSL will periodically reference insurance status of individuals in relation to The Affordable Care Act in order to provide a clearer picture of the needs of the surrounding community.

### Prioritized Needs of the Houston Methodist Sugar Land Community:

- **Primary Care Services:** Increase access to primary care services for the surrounding community.
- **Specialty Care Services:** Reduce barriers to accessing specialty care services for the surrounding underserved community.
- **Mental Health Care Services:** Increase access to mental health care services within the surrounding underserved community.
- **Healthy Living Behaviors:** Promote healthy living behaviors that reduce the likelihood of chronic disease development.

In the following pages, the above prioritized needs will be addressed. Though the following priorities are ordered, this is not in direct correlation with the level of importance by which Houston Methodist Sugar Land will address each.

Data Source: Enroll America
Increase access to primary care services for the surrounding community.

Primary care consists of services by physicians trained in comprehensive first contact and continuing care of a patient. These services include health promotion, disease prevention, health maintenance, health education and diagnosis and treatment of acute and chronic illnesses that do not require specialized care.

Access to primary care greatly impacts the overall health of a community. Primary care physicians are able to serve a patients’ basic medical needs and potentially prevent the development of chronic conditions through assessing wellbeing on a continual basis. Primary care services also reduce expensive and unnecessary utilization of emergency departments. The earlier and more often a patient is seen by a primary care physician, the less likely they are to require hospitalization.

Dr. Abhishek Kansara, MD, MPH, a Houston Methodist Endocrinologist, acknowledges the necessity of primary care. “Some [patients] may not seek out routine health care until a catastrophic illness has occurred. I do emphasize to my patients, friends and family to establish contact with a primary care physician on a regular basis to avert such scenarios”.

It is important to note that HMSL has begun to combat the physician shortage issue through the expansion of the Houston Methodist (HM) system’s Primary Care Group (PCG). PCG was designated in 2013 and between 2013 and 2015 was able to add 58 primary care physicians to the HM service areas. This initiative to expand the access of primary care physicians continues to grow.

The following barriers have been identified by Houston Methodist community stakeholders as needs to address in order to improve access to primary care in the Houston-Sugarland-Baytown MSA:

- Physician shortages and increasing demands for service.
- Insurance challenges and affordability.
- Location of services and available appointment times.
**Physician Shortages:**
There are not enough primary care physicians to meet the growing population of the designated MSA, which is expected to grow by 8% between 2015 and 2020. An increase in primary physician supply is directly associated with improved health outcomes, including cancer, heart disease, stroke, infant mortality, low birth weight, and life expectancy. Research shows a 1% increase in primary care physician supply is associated with a decrease of 503 hospital admissions, 2,968 emergency room visits, and 512 surgeries.¹³

Texas ranks low, 47th in the country, for primary care physician to patient ratio. Houston/Harris County has 19 designated medically underserved areas (MUAs), which are areas or populations designated as having too few primary care providers, high infant mortality, high poverty or a high elderly population. The table below shows the number of primary care physicians in each county as well as the physician to population ratio.¹³i

*Designated Health Professional Shortage Area

Title V of the ACA, “Health Care Workforce” acknowledges the lack of health care workers, particularly primary care providers, available to serve the growing population. The majority of the population’s health problems do not require a specialist, yet specialized physicians have received incentives that have proven detrimental to growing a primary care physician supply. This section of the ACA is aimed at determining ways to increase the availability of primary care providers by providing “state and local governments flexibility and resources to develop health workforce recruitment strategies” and to “expand critical and timely access to care by funding the expansion, construction, and operation of community health centers throughout the United States.”³³i

**Increasing Demand:**
Physician shortages are due partly to an increase in demand created by a rapidly growing state population, an aging population, and a growing number of insured patients. Furthermore, in order to maintain an adequate supply of physicians in Texas, the number of available medical residencies in the state must increase by 589 positions by 2022.³⁴iv One concern is that the shortage of primary care physicians will be further exacerbated as new physicians choose to pursue specialty care rather than primary care due to factors related to compensation. Primary Care physicians are compensated approximately 31% less than specialty care physicians.³⁴iv Going further, facilities such as free clinics that primarily serve the uninsured and underinsured may provide even lower compensation for physicians due to operational/budget limitations.

“When I look at the turnover rates over the years with providers, our family practice physicians are the ones we have the hardest time recruiting,” says Marcie Mir, LCSW, Chief Executive Officer of El Centro de Corazon, a Federally Qualified Health Center (FQHC) located in Harris County. “It ties in to the overall shortage that we have for family practice physicians. Then you look at Houston and the Houston market with the major hospital institutions. We can’t compete. We can compete with the salaries but not the signing bonuses and not with the benefits.” Challenges in recruitment of primary care physicians for health care facilities located in MUA’s include longer working hours, less financial reward for service, and less access to highly technological approaches to diagnosis.

Even if a clinic is deemed to be fully staffed, time constraints on primary care physicians may lessen their ability to provide comprehensive primary care services.
According to Dr. Julia Andrieni, Vice President of Population Health for Houston Methodist, with the current shortage of primary care physicians, new multi-disciplinary patient care models need to be developed to bring care to medically underserved communities, “Primary Care physicians who choose to make a difference within a specific community become advocates for that community and serve as role models for future Primary Care physicians. Internal Medicine and Family Medicine residents with clinical rotations in medically underserved areas provide not only a learning opportunity but the much needed care for vulnerable populations.”

Due to growing demand and competition for an already small primary care physician pool, Nurse Practitioners (NPs) and Physician Assistants (PAs) are valuable assets in community settings, particularly those serving uninsured populations. About 90% of NPs are trained in primary care, and studies have shown that NPs are able to manage 80-90% of care provided by primary care physicians. Primary care PAs are able to manage much of the care provided by primary care physicians as well, and the supply of primary care PAs is projected to increase by 58% between 2010 and 2020. Furthermore, research has shown that primary care outcomes including mortality, reduction of symptoms, hospitalization and patient satisfaction are equal between patients served by either NPs or PAs and physicians in a primary care setting. Effective integration of NPs and PAs into the healthcare system could greatly alleviate the increasing demand for primary care in the growing Houston Methodist Hospital community.

Insurance Challenges:
Seventy-five percent of our community survey respondents cited “lack of insurance” as one of the top barriers to seeking medical treatment. Insurance reforms outlined in the Affordable Care Act took effect on January 1, 2014, requiring all citizens of the United States to purchase health insurance or pay a penalty. The Health Insurance Marketplace offers insurance for individuals who cannot obtain insurance otherwise through a job, Medicare, Medicaid, or another source that provides qualifying coverage. Approximately 4% of the MSA is insured through the Marketplace. This equates to 279,275 total individuals. In comparison, 838,008 Texans (approximately 3%) are insured through the Marketplace.

The population served by Federally Qualified Health Center, Access Health, located in Fort Bend County reported similar barriers (see table 16 below). Houston Methodist interviewed the CEO of Access Health, Carole Edwards, for her insight on the challenges the population faces in regards to insurance:

“When we went through all of the outreach and enrollment for the ACA, our statistics showed, of all the people who came in to register, 72% of them didn’t qualify because they were less than 100% of the Federally Poverty Level... One of the things that we found, a lot of people signed up for the cheapest plan but then they find out it doesn’t cover anything and they have these huge deductibles.” (C. Edwards, personal communication, December 13, 2015)

Data Source: Houston Methodist Health Needs Survey 2015
Texas has the highest number of uninsured adults in the nation. Each year, Texas hospitals cover $5.5 billion in costs incurred by uninsured individuals. In 2015, 18% of the MSA population was uninsured. In early 2015, Texas voted to reject expansion of Medicaid, the federal insurance program for those living in poverty, therefore declining an estimated $100 billion in federal funding over the next decade. If Texas had expanded Medicaid, an estimated 1.2 million uninsured Texans would have qualified for Medicaid coverage.

Data Source: Texas Medical Association

The number of MSA residents covered through Medicare, the federal insurance program for adults 65 and over, is expected to grow by 28% by 2020. 14% of the population is insured through Medicaid. It is important to note that 35% of Texas physicians do not accept Medicaid, and 18.3% do not accept Medicare. Both are low acceptance rates in comparison to other states. Texas ranks 43rd in number of physicians participating in the state Exchanges established through the ACA. These low insurance acceptance rates are primarily due to low reimbursement rates. Though insured, these patients face barriers to finding providers for even the most basic care.

766,000 Texans fall into the Medicaid coverage gap, which means that they earn too much to qualify for the state’s Medicaid threshold but not enough to meet the criteria for financial assistance through the Affordable Care Act’s Marketplace. These individuals are left stuck between two income eligibility lines and with little support for purchasing insurance. Individuals may choose to pay the penalty for not having health insurance rather than pay high premiums.

“What we’re hearing is these people are falling in the gap where they don’t qualify for Medicaid and they can’t afford the ACA,” explains Cathy Sbrusch, the Director of Public Health Services for Brazoria County. “I figured it would impact our indigent program that as people got jobs they would come off our program, but we aren’t hearing from our patients they are doing that. I don’t think they can afford it. It has to be affordable. People are choosing between food and medicines versus insurance. They don’t go to the doctor when they have a small problem, and then it gets big. And what follows is so much worse.” (C. Sbrusch, personal communication, December 7, 2015).

A study conducted by the Department of Health Management and Policy at the Johns Hopkins Bloomberg School of Public Health found that even when uninsured individuals are able to get an appointment with a primary care doctor, the quoted price of the visit is beyond their affordability. The average quoted price was $160, yet significantly lower at Federally Qualified Health Centers ($109). Prices were also lower for offices in ZIP codes with higher poverty rates. Only 18% of patients were told they could bring less than the full amount due to the visit, and those that could arrange a payment plan were told they must bring on average 61% of the total cost to the appointment. The price of the appointment alone represents around one-tenth of the monthly income of an adult living in poverty. Uninsured adult Texans were twice as likely to forego primary care due to cost than those with insurance. The chart below details the differences between the uninsured and the insured in their decisions to skip various types of medical care.

Table 19
Poverty and Affordability:
Sixty-four percent of our community survey respondents cited “unable to pay co-pay/too expensive” as one of the top barriers to seeking medical treatment. It is important to note that the majority of those surveyed fall into the financially indigent category. This unique population was surveyed primarily because HM recognizes they are the most vulnerable to the effects of the changing economic landscape. With that noted, through research, it was uncovered that approximately 16.3% of the MSA (with all economic statuses and the total population considered) currently lives below the FPL. Fort Bend County accounts for 8.9% of its residents living below the FPL. Unemployment and underemployment are directly associated with higher levels of poverty. Currently, the unemployment rate in Brazoria County is 4.0% and Fort Bend County is approximately 3.8%. The economic status of those living in the surrounding MSA can have a strong impact on their ability to access social and healthcare services. Though health insurance decreases the cost of medical care for patients, there remains a gap. Patients who have insurance, yet are unable to pay the out-of-pocket costs, are considered underinsured. According to Dr. Stephen Linder, Associate Director of the Institute for Health Policy at the University of Texas School of Public Health, “Insurance is not the big deal- its coverage. Even though the ACA has a mandate for coverage, that purchase of coverage tends to be restricted to catastrophic care. If your chronic disease requires management, all of those costs are going to be out of pocket. ACA puts coverage in the hands of people who were previously uncovered, but affordability is still a huge issue. And so, the problem is out-of- pocket costs, which suggests that the deductibles and the copays are too high in ensuring that people get basic care” (S. Linder, personal communication, December 1, 2015).

Provider Location and Transportation:
The MSA contains both urban and rural communities. A primary care physician’s proximity to a patient population is correlated with an increase in patient utilization of primary care services. Many stakeholders expressed concern about patients getting to appointments, especially in more rural regions of the MSA where provider options are limited and therefore patients must travel longer distances to receive care. These areas also have limited public transportation options in comparison to more urban settings. Without a serious condition requiring medical attention, many patients may choose to forego receiving primary care, placing a larger burden on specialty care and the emergency departments within hospital systems. Though the primary counties served by HMSL present their own unique challenges from the rest of the MSA counties, the transportation challenges individuals face can be summarized by the findings of transit community leaders:
“The primary challenge to public transportation is having enough resources to provide high quality service to a city as large and dispersed as Houston,” expresses Geoff Carleton, Principal at Traffic Engineers, Inc., a Houston based transportation planning firm that has overseen the Metro Transit System Reimagining project. “Safe, ADA accessible sidewalks, attractive bus stops, bicycle connectivity, service that arrives frequently seven days a week, and transit that is prioritized in high congestion areas are all components of a well-functioning transit system and are challenges in many areas of Houston.” In response to those challenges, Carleton proposes “designing healthcare facilities that consider people arriving in transit as much as they do people arriving in cars, creating covered sidewalks and short walking distances for people, investing in better sidewalks, and investing in more bus stops with frequent service on routes serving healthcare facilities.”

15% of Houston Methodist Survey respondents cited Transportation as a barrier to care.

In an effort to combat some of the transportation barriers, Houston Methodist (HM) has expanded its reach in the community so that the population most underserved can still receive the quality care of the HM system without further being burdened by the obstacles that the Texas Medical Center can present. The expansion of the PCG along with the Houston Methodist Physicians’ Alliance for Quality (MPAQ) has allowed the hospital system to have a larger reach in the surrounding service areas. MPAQ serves as an additional network of care that community members can work through and brings top quality physicians to the neighborhood of the patient. As of 2015, HM added 232 physicians to MPAQ. In addition, for more than 10 years, Houston Methodist has positioned its Family Medicine Residency Program in the Harris County located, Denver Harbor Clinic. Denver Harbor Clinic is located in a medically underserved area. Physicians and residents are able to provide primary care services in the community that patients live in. The clinic is located along a Metro bus route which increases ease of access.

Safety Net Clinics:
According to The State of Health in Houston/ Harris County, there are 144 safety net clinics in the Greater Houston community, with 105 (78%) located in Harris County and only one Federally Qualified Health Center located in Fort Bend County, Access Health. Safety net clinics provide a range of healthcare services to the uninsured in the designated MSA, who are estimated to need approximately 4.2 million visits annually. Patients who do not utilize these clinics obtain care from emergency rooms, private clinics, or forego healthcare. Harris County Hospital District is the largest safety net provider in the MSA, serving 66.4% of the safety net population.

It is estimated that safety net providers are currently meeting approximately 30% of primary care visit demand by the MSA’s low income population. This demand is anticipated to grow by 30%, and therefore current safety net providers will be able to meet less than 25% of demand in the upcoming years. In order for safety net providers to meet 100% of demand over the next nine years, the capacity to provide primary care within these settings will need to increase by 17-18%, per year. In order to simply maintain the 30% of demand that is currently met, capacity needs to increase by 2-3% per year."

Reduce barriers to accessing specialty care services for the surrounding underserved community.

A primary care physician will refer a patient for specialty care for more thorough diagnoses and treatment of a particular disease state, such as heart disease or chronic obstructive pulmonary disorder (COPD). Specialty care must be received in a timely manner in order to avoid a cycle of unmanaged health complications. For many, specialty care is considered a luxury and something that is not attainable due to the high cost and coordination of care that is often necessary to get a patient connected to a specialist.

The following barriers have been identified by Houston Methodist community stakeholders as needs to address in order to improve access to specialty care in Houston:

- High demand for specialty services and long wait times.
- Affordability and insurance.
- Adequate provision of a continuum of care.

High Demand with Limited Options:
Few clinics that serve low-income patients have specialists on staff, and sometimes the clinics have no direct connection with specialists, who are usually affiliated with hospitals or large practices. Even when there is an established connection, arranging timely and affordable specialty care may be nearly impossible. According to Dr. Donald Briscoe, Medical Director of Vecino Health Centers located in Harris County and the Chairman of the Department of Family Medicine at Houston Methodist Hospital “For our patients, the biggest medical barrier is access to specialty care. It is expensive. It takes a long time to get people in. Our primary referral source is to the Harris Health System so people need to qualify for that and there is such a demand on that system it can take a very long time to get access”. (D. Briscoe, personal communication, December 11, 2015)

Conversely, residents of Fort Bend may encounter different barriers to specialty care than adjacent counties such as Harris. According to Access Heath CEO, Carole Edwards, “There are two things that are really unique to Fort Bend County. One is, where we live there is no public transportation. The other is, since we don’t have a hospital district we do not have specialty care for the uninsured. We are able to get people hospitalized for things that are an emergency or if it is something they have to have like an appendectomy. However, if they need a hernia repair they are not going to get that. If they need that one little thing to get back to work, they don’t have a way to do that. We send a lot of our patients to Gateway to Care in Houston and they told us about 85% of the patients they serve are from Fort Bend County.”

The leading causes of death in Texas are heart disease, cancer, stroke, diabetes, and chronic lower respiratory disease. Patients with these diseases have been found to have better health outcomes when managed by a specialty care physician, but due to the high prevalence of these diseases, there is an increased demand for specialists that treat these diseases. For indigent patients with limited provider options, wait times for seeing a specialty care physician are even longer than for those who have a wider network of options.

Several stakeholders voiced concerns about wait times for these patients, especially those with diagnostics indicating serious illnesses that require immediate attention.

Higher Cost of Specialty Care:
Specialty care, by nature, is more expensive than primary care, and when needed, is usually vital to the patient’s health. Diagnostic testing is often required to refer a patient to a specialist, and the cost of testing alone can be a barrier. In 2010, 25% of referrals to Harris County Hospital District were denied because patients were unable to complete the pre-diagnostic testing required.\textsuperscript{lviii}

Between 2008 and 2013, Fort Bend County residents received more than 7 billion dollars ($7,348,148,723) in charges for hospitalizations that were potentially preventable, indicating that if the individual had access to appropriate outpatient healthcare, the hospitalization would likely not have occurred. Fort Bend County residents received $596,054,263 in preventable charges between 2008 and 2013. The chart below shows the number of hospitalizations in 2013 in Fort Bend County, per potentially preventable disease, including the average hospital charge per disease.\textsuperscript{lix}

Data Source: Texas Department of Health and Human Services

Furthermore, specialty care may require more frequent visits and testing, which increases out of pocket costs to the patient. Kara Hill, the Chief Executive Officer of Christ Clinic in Fort Bend County, is concerned that patients are not able to pay for prescriptions and further care associated with specialty care. “Many of our patients, let’s say you are above 100% of poverty and you are between 100% or 150%, of poverty, that is really low income,” says Ms. Hill. “The high deductibles and the high copays and the high cost of prescriptions after you are paying $100 a month or $200 a month in your insurance premiums, it seems very overwhelming for people with income levels that are still super low. We just had a patient talk about how it is completely not affordable for her because she has to be on all these medications that it isn’t going to cover, the insurance wasn’t going to cover. It just remains unaffordable.”

**Gaps in Providing a Continuum of Care:**

Challenges identified by a large majority of stakeholders was effectively and efficiently referring patients once a need for a specialty care referral has been identified, as well as the ability to provide a full continuum of care once the patient begins to be seen by a specialist who may determine that a patient requires expensive treatments or procedures.

Primary care physicians are challenged with finding specialists included in health insurance plans, particularly those plans purchased on the Marketplace that have narrow networks. Insurance usually falls into two categories: either a Preferred Provider Organization (PPO) Plan or a Health Maintenance Organization (HMO) Plan. A PPO offers a network of providers to choose from, with the ability to see providers both in and out of the network, though out of network providers will be more expensive. An HMO offers only the ability to see a provider in the network, which in some regions, particularly in areas with limited medical resources, can be challenging. In 2016, there are no PPO plans available to individuals in Houston through the Marketplace.

According to Marcie Mir, LCSW, Chief Executive Officer of El Centro de Corazon, “It really is looking at trying to determine the most efficient, effective way to provide the uninsured and underserved, the people who really don’t have a lot of access to healthcare, how to provide them specialty care. You look at Harris Health- this is one of the only ways for them to get in and then it takes so long for them to be able to access that care. When you look at the overall size of Houston and the cost of specialty care, there is a whole population that is just left not being able to access that particular care”

She further explains the dilemma of screening and diagnosing patients that have little resources to cover continued specialized care. “If you think about it, if a mammogram result comes back positive and we try to connect [the patient] to the public hospital system in Houston, the average wait time to get in is 3-6 months. When you are diagnosed with possible cancer, you and I would be able to find resources within a blink of an eye but for patients that El Centro serves, not so much” (M. Mir, personal communication, December 17, 2015).

**Lack of Specialty Care Physicians in Underserved Populations:**

Because specialty care physicians are compensated at a higher rate than their primary care counterparts, settings that provide care for the underinsured and uninsured may not be able to compete with larger institutions to obtain these specialists. Federally Qualified Health Centers (FQHCs) are required to provide primary care services to patients on-site, but are not required to provide specialty care, and therefore depend primarily on external sources to support specialty care clinics.

Most specialty care physicians working in FQHCs and free clinics are providing care pro-bono or through external programs which provide support for the clinic. Otherwise, the majority of specialty care must be referred out of the clinic, possibly leading to broken referral chains and/or long wait times, further increasing the barriers to accessing specialty care.
Promote healthy living behaviors that reduce the likelihood of chronic disease development.

Preventative Care:
Preventative care is key in detecting illness and keeping it at bay. It includes services such as screenings, check-ups and counseling. Examples of preventative care include immunizations, well woman check-ups, and colonoscopies. Encouraging patients to participate in preventative care leads to a decrease in the prevalence and severity of many diseases and conditions such as heart disease, certain kinds of cancer, and stroke. According to Dr. Mary desVignes-Kendrick, Director of the Fort Bend County Health Department, “We need to make preventative care services more accessible, affordable, and accommodating. This increases the likelihood of receiving preventative care.” (M. desVignes-Kendrick, personal communication, December 8, 2016).

Despite the importance of preventative care, many people choose not to seek it out. For example, of the 1,000 Houstonians surveyed for this report, only 40% had received a well woman/man exam within the last year and only 44% had been to the dentist in the past year. Regarding barriers to preventative care, Katy Caldwell, CEO of Legacy Community Health, the largest FQHC in the state of Texas, says, “We are a society that always goes to the doctor when you feel bad. You don’t go to the doctor for regular checkups for that type of preventative care so you don’t think about it. You forget about it.” (K. Caldwell, personal communication, December 22, 2015).

Furthermore, encouraging certain lifestyle modifications such as balanced nutrition and physical activity can contribute to preventative care and may decrease the likelihood of certain diseases to develop. Dr. Linder adds, “When people think about health problems they tend to define them in terms of clinical care and what problems clinical care addresses. Part of that is trying to understand better what health involves on a daily basis independent of the clinic and things people can do for themselves to improve the quality of their health and wellbeing.” The findings from the Houston Methodist survey uncovered the health status of residents living in the MSA:

Data Source: Houston Methodist Health Needs Survey

Obesity and Physical Activity:
Adults who have a BMI of 30 or higher are considered obese. While obesity is not a primary cause of death, it is a leading contributor to coronary heart disease, type 2 diabetes, cancers (endometrial, breast and colon), hypertension, and stroke. According to Dr. Abhishek Kansara, Endocrinologist for Houston Methodist, “Not all overweight or obese patients may be currently ill or have other associated medical conditions, but it does put one at a higher risk of developing an array of chronic medical conditions which often persist lifelong.” Dr. David Chiu,
medical director of the Houston Methodist Eddy Scurlock Stroke Center, adds “Obesity is an important cause of conditions like hypertension, diabetes, and metabolic syndrome, which are potent risk factors for stroke, dementia, and vascular disease” (D. Chiu, personal communication, November 24, 2015). Of the total respondents from the Houston Methodist Health Assessment Survey, 35% reported having been told that they are overweight. Specifically, 41% of patients surveyed at the Access Health facility in Fort Bend County indicated obesity was a primary health issue. According to the Texas Department of State Health Services Behavioral Risk Factor Surveillance System\textsuperscript{lx} overweight and obesity are more pronounced in minorities and middle-aged adults. 

\emph{Table 22}

![Obesity Rates by Ethnicity in Harris County](image)

\textit{Data Source: BRFSS, 2014}

Although men are more likely to be overweight, women are more likely to be obese. Obesity is caused by an energy imbalance. According to the CDC, “this involves eating too many calories and not getting enough physical activity”. Therefore, it is important to note that 35% of people in the Houston-Baytown-Sugarland MSA report no physical activity per week. Regarding physical activity, Dr. Linder notes, “When thinking about prevention, the number one problem is inactivity, which affects virtually all of the top chronic diseases except cancer.”

\textbf{Immunizations:}
As a result of safe and affordable vaccinations, rates of diseases such as measles, mumps, and tetanus are near record lows.\textsuperscript{lx} However, incidences of vaccine preventable disease still persist.

\emph{Table 23}

![Cases of Vaccine Preventable Disease in MSA](image)

\textit{Data Source: Harris County PHES}
Barriers to immunizations are varied and include cost, lack of a system to track previous vaccines, and competing demands from physicians. Dr. Ann Barnes, MD, MPH, Chief Medical Officer of Legacy Community Health, an FQHC in Harris County that also serves residents in the Houston Methodist MSA, adds, “Public health and healthcare systems focused on population health have got to think creatively about how we bring these evidence-based strategies to people where they are. Perhaps a nurse should walk through a business office with flu shots in-hand to vaccinate people at their desks, or attend a church service and vaccinate the pastor in front of his or her congregation with an invitation to vaccinate anyone else who’s interested.” (A. Barnes, personal communication, December 20, 2015).

Vaccines for influenza are widely available and can reduce the risk of illness by 50-60%.

Every year, approximately 23,000 people die from the seasonal flu in the United States. The CDC recommends that adults over 65 receive a vaccination against influenza. However, in Harris County, 41.4% of adults age 65 and older reported not receiving a flu vaccine in the past year. This number is higher than both the state and national average, at 40.6% and 33.0% respectively. However, of the 1,000 Houstonians who were surveyed for this report, only 36% had received a flu shot in the past year.

**Drug, Alcohol, and Tobacco Use:**

**Tobacco:** Reducing tobacco use is a priority in the community served by Houston Methodist Sugar Land (HMSL) and nationally. According to Healthy People 2020: “Tobacco use is the single most preventable cause of death and disease in the United States”. The use of tobacco is associated with numerous diseases such as stroke, diabetes, multiple cancers, and heart and vascular disease. Each year, over 440,000 Americans die from diseases related to tobacco. The CDC reports that Harris County’s tobacco use rate is slightly higher than the state average, 16% and 17% respectively.

Additionally, secondhand smoke exposure contributes to several health conditions. The CDC defines secondhand smoke as “Smoke from burning tobacco products, such as cigarettes, cigars, or pipes” or “smoke that has been exhaled, or breathed out, by the person smoking”. Secondhand smoke can cause conditions such as respiratory infections, asthma attacks, ear problems, heart disease, and lung cancer. The CDC also adds that even brief exposure to secondhand smoke can be harmful to one’s health. Secondhand smoke can cause conditions such as heart disease, lung cancer, and stroke.

**Drug Use:** According to the National Survey on Drug Use and Health, an average of 490,000 people in the Houston-Baytown-Sugarland MSA used illicit drugs in the past year. This is representative of nearly 12% of the total population. This number is similar to the Texas rate (12.6%) and lower than the national rate (14.7%). Specifically, marijuana use has experienced a steady incline in Texas. This number has increased from slightly over 20% in 2007 to nearly 25% in 2011. According to the Fort Bend Council on Substance Abuse, 26% of Fort Bend County high school students reported use of marijuana with the average age of first use being 14 years old. Behind marijuana, the second most commonly used illicit drugs are nonmedical pain relievers. However, the use of nonmedical pain relievers decreased for both adolescents and young adults from 2002 to 2012. It is also important to note that 8.9% of the population in the Houston-Baytown-Sugarland MSA were classified as having a substance use disorder.

**Alcohol:** Binge alcohol consumption is defined as having more than five drinks on the same occasion. The report from the National Survey on Drug Use and Health states that 25.1% of the population age 12 and older in the Houston-Baytown-Sugarland MSA have participated in binge alcohol consumption in the past month. Additionally, 28.2% of people age 18 and older have participated in binge alcohol consumption in the past month. 46% of Fort Bend County high school students reported using alcohol with the average age of first use being 13. Binge drinking is associated with health conditions such as unintentional injuries, alcohol poisoning, liver disease, cardiovascular disease, and poor control of diabetes. Furthermore, binge drinking is associated with other intentional injuries such as sexual assault and domestic violence.
Sexually Transmitted Diseases:
Sexually transmitted diseases (STDs) are infectious diseases that spread from one person to another via sexual contact. They are usually spread through contact with infected body fluids such as semen, blood, and vaginal fluids, but can also be spread through sores in the mouth. The transmittal of STDs can often be prevented through the use of both condoms and dental dams, as well as abstinence.

Despite the fact that STDs are preventable, the CDC reports that rates of chlamydia, gonorrhea, and syphilis are on the rise. The incidence of all three of these diseases have increased steadily in recent years.\textsuperscript{lxvi}

Chlamydia
Chlamydia is the most commonly reported STD in the United States. When untreated, chlamydia can lead to pelvic inflammatory disease in women which is a major cause of infertility and ectopic pregnancy. Between the years of 2013 and 2014, rates of chlamydia increased 2.8% overall. In Harris County, rates of chlamydia increased by more than 27.3% from the years 2009-2013. In 2013, the rate of chlamydia was higher in Harris County than in Texas, at 538.2 cases per 100,000 and 478.3 cases per 100,000 respectively.\textsuperscript{lxvi} Comparatively, Fort Bend County had a lower rate than both Harris County and Texas in 2013 at 218.4 per 100,000 people.

Prevalence of of chlamydia is significantly higher with African Americans than any other racial or ethnic groups.

Gonorrhea
Gonorrhea, the second most commonly reported STD in the United States, is a major cause of pelvic inflammatory disease. Similar to chlamydia, untreated gonorrhea may cause infertility, ectopic pregnancy, and chronic pelvic pain. Furthermore, when left untreated, gonorrhea may facilitate the transmission of HIV. In the United States, the rate of gonorrhea has increased by 10.5% between the years of 2010 and 2014. Rates of gonorrhea are higher for men than women, at 120.1 cases per 100,000 and 101.3 per 100,000 respectively. In Harris County, the rate of gonorrhea is 153.4 per 100,000.\textsuperscript{lxvii} Comparatively, Fort Bend County has a much lower rate of gonorrhea at 57.9 per 100,000.\textsuperscript{lxviii}

Data Source: CDC Reported Cases of STDs, 2014
Syphilis is an STD that, when left untreated, can facilitate HIV transmission and may also cause brain damage and blindness. Syphilis may also have severe ramifications for pregnant women, potentially leading to infants who are either low birth weight, preterm, or stillborn. In 2000 and 2001, the national rate of syphilis was 2.1 cases per 100,000, which is the lowest rate since reporting began in 1941. However, since 2000, the rate of syphilis has increased steadily. The increase in cases has mainly been attributed to gay and bisexual men. However, rates for both men and women have increased during this time. Harris County rates of syphilis have increased from the years 2011 to 2014, from 38.6 cases per 100,000 to 44.6 cases per 100,000 respectively. Similarly, Fort Bend County rates of syphilis have also increased from the years 2011 to 2014, from 12.7 cases per 100,000 to 13.9 cases per 100,000 respectively. The number of cases of syphilis are significantly higher for African Americans than any other race or ethnic group.

*Data Source: CDC Reported Cases of STDs, 2014*

**Human Immunodeficiency Virus**

Human Immunodeficiency Virus (HIV) destroys important cells that fight disease and infection in your immune system. Currently, there is no cure, although advances in medicine have allowed for control of HIV. HIV has several phases, the last of which is AIDS. Once people with HIV have developed AIDS, their survival time is three years on average.

AIDS is a significant cause of death in many populations. It’s estimated that over 658,000 people in the United States have died from AIDS. In 2012 alone, 13,712 people in the United States died.

It’s estimated that 1.2 million people in the United States are currently living with HIV in the United States. Of this number, about 12.8% are unaware that they are infected. As of December 2012, 21,017 people were living with HIV and AIDS in Harris County. An estimated 18% of these cases are undiagnosed, which means that a potential 3,783 additional residents of Harris County are unaware they are infected.

**Table 28**

*Data Source: Harris County Public Health and Environmental Services, 2014*
**Human Papillomavirus**

Human Papillomavirus, or HPV, is the most common sexually transmitted infection in the United States. Without treatment, HPV may cause cervical cancer or genital warts. In fact, HPV is responsible for 70% of cervical cancer cases diagnosed worldwide. In 2006, a vaccination was developed to prevent HPV. This vaccine is recommended for females ages 11-26 and males age 11-21 who have not been previously vaccinated. Although Healthy People 2020 established a goal of 80% adherence to the vaccination, recent data shows significantly less adherence to the recommendation.

*Data Source: CDC Reported Cases of STDs, 2014*
Increase access to mental health care services within Houston Methodist Hospital’s surrounding underserved community.

Prevalence:
Mental health disorders affect both the health and productivity on a society as a whole. In fact, adults suffering from mental illness tend to die on average 25 years sooner than those without a mental illness. An adult with mental illness can be described as “having a diagnosable mental disorder that results in functional impairment that interferes with major life activities”.

The Health Status of Texas report estimates that the prevalence of mental illness is just under 3%. Over 181,000 people included in this number have a mental illness that is classified as severe and can affect their daily functioning. In a survey performed by the Department of State Health Services, 20% of Texas adults reported poor mental health.

The most prevalent diagnoses for mental illness include bipolar disorder, major depression, schizophrenia, panic disorders, and obsessive-compulsive disorder. According to The Consequences of Mental Illness in Houston report, one in every five Houstonians has a mental illness. Furthermore, an estimated 1/3 of the Houston population are in a close network of someone with a severe mental illness. Annually, more than 5.6 billion dollars in productivity are lost as a result of mental illness in Houston. Unfortunately, less than half of people diagnosed with a mental illness receive treatment for it. Cost, provider shortage, lack of diagnosis, stigmas, and wait times are just a few of the barriers to treatment.

Cost:
Funding for mental health services come from both private and public sources. Private sources include private health insurance and out of pocket payments. Public sources include governmental funding (federal, state, and county) as well as funding from non-profit agencies. Texas and Houston in particular fall way behind the national average when it comes to public funding. The Consequences of Mental Illness in Houston report states: “Texas ranks 49th in state per capita mental health funding, and Harris County (greater Houston) ranks among the lowest in Texas counties”. The lack of funding from public sources can place the burden of seeking mental health services on an individual, which can prohibit patients from receiving the care they need.

<tr>
<td>Texas</td>
<td>$39</td>
</tr>
</tbody>
</table>

Data Source: Houston Chronicle, 2014
Funding from private sources also presents challenges. Psychiatrists are less likely than other physicians to accept health insurance. In fact, only 55% of psychiatrists accept private insurance, compared to 89% of other practitioners. This situation is even further complicated for Medicaid patients. Only an estimated 43% of psychiatrists accept Medicaid, compared to 73% of other practitioners. A main reason for this discrepancy relates to the time it takes for psychiatrists to perform counseling and therapy. Because they spend more time with patients than other practitioners, they may have fewer patients and would therefore be unable to balance insured patients with the significantly lower reimbursement for those patients with Medicaid.

**Provider Shortage:**

Texas and Harris County in particular suffer from a lack of mental health service providers. A lack of trained mental health professionals, as well as inpatient facilities with the capacity to treat mental health disorders, are a significant barrier to treatment. A lack of beds often means that “places like the Harris County jail end up serving as de facto mental health facilities. Jails are not hospitals, and staff simply aren’t trained or equipped to treat mental health.”

Furthermore, 185 counties in the state of Texas lack a general psychiatrist. Included in those counties are both Waller and Wharton counties. Wharton County is included in Houston Methodist Sugar Land’s service area. Steve Duson, Executive Director of Interface-Samaritan Counseling Centers, said, “The shortage of providers – particularly psychiatric services in low density populations – seem to be a serious issue.”

The Mental Health and Mental Retardation Authority of Harris County treats nearly 50,000 patients a year. Currently, this agency experiences a wait list of 1,600 adults suffering from serious mental illnesses such as bipolar and depression. The primary reason for the wait list is a lack of clinicians. Although the agency is looking to expand services, they currently do not have enough psychiatrists to facilitate this expansion.

**Physician Referral:**

Primary care physicians are often the sole source of health care used by patients with a mental disorder. An estimated 11-36% of patients who see a primary care physician suffer from a mental disorder. Though this may increase access for many patients, the utilization of primary care physicians as the main source of treatment for mental health may still lack both intensity and quality. Only an estimated one third of patients who are treated for mental health by their primary care physicians receive minimally adequate care. Many primary care physicians lack the appropriate training and experience to treat mental health disorders.

Many primary care physicians report difficulties in making mental health care referrals for their patients. Reasons for these difficulties include manpower shortage, insurance coverage, problems with the actual referral process, and location. Furthermore, in the rare instances that primary care physicians are able to initiate a referral, the rates of patients completing the referral process is often low.

**Stigma:**

One of the most significant barriers to care for mental health is stigma. Stigma is defined as “when someone views you in a negative way because you have a distinguishing characteristic or personal trait that is thought to be, or actually is, a disadvantage.” Stigmas often lead to discrimination and can negatively impact those with mental health disorders. Respondents from the Community Health Needs Survey were asked if they agree with the following statement “People are generally caring to people with mental illness.” Of the 1,000 respondents, only 54% agreed. Carol Edwards, CEO of Access Health, adds, “I think it is a lot less acceptable to talk about. People don’t want to admit there is something wrong but there’s also, I think, an ignorance of what it actually is and if there are things that can help.”
The following have been identified as harmful effects of stigma associated with mental health:

- Reluctance to seek help or treatment
- Lack of understanding by family, friends, co-workers or others you know
- Fewer opportunities for work, school, or social activities or trouble finding housing
- Bullying, physical violence, or harassment
- Health insurance that doesn’t adequately cover your mental illness treatment
- The belief that you will never be able to succeed at certain challenges or that you can’t improve your situation

_Data Source: Mayo Clinic, 2014_

The stigma due to mental illness is “largely due to our lack of understanding of its causes and its occasional bizarre symptoms.” Often, people will avoid thinking of mental illness because of both fear and denial, which can contribute to denial of treatment. Duson adds, “Looked at holistically, there is some behavioral health component to almost every health issue. Treated in isolation, neither the mental health issue nor the medical condition can be dealt with as effectively. Some degree of care for the spirit and the mind are part of almost every presenting medical issue. A good case could be made that everyone with a health problem – 99% of the population – will have a treatable mental health component to their condition.”

Results of the Houston Methodist Health Needs Survey revealed community members were somewhat split on the statement of whether or not people were generally caring to people with mental illness. This sentiment could provide some insight into reasons behind resistance of members of the community seeking mental health care. See charts below.

Source: Houston Methodist Health Needs Survey 2015
Conclusion:

This Community Health Needs Assessment (CHNA) report provides the foundation for Houston Methodist Sugar Land’s efforts to guide community benefit planning to improve the health status of the supported community. The priorities outlined in this report will serve as the foundation for the formulation of the Houston Methodist Sugar Land Implementation Plan for 2016-2019.

The appendix at the end of this report will provide the following additional resources of information:

- Community Health Issues Not Addressed
- List of Stakeholders Interviewed
- Health and Social Disparities by Race
- Community Resource List
- Works Cited

Please note that this assessment and the subsequent implementation plan will be routinely re-evaluated in order to ensure that Houston Methodist is responding in the most impactful ways to the most pressing health needs of the greater Houston community.
Community Health Issues Not Addressed:

Houston Methodist will not be addressing the following needs. The listed needs received the lowest rankings when submitted to public health experts, stakeholders and community members. In addition to the lower ranking in correlation to the selected prioritized needs, Houston Methodist has provided additional rationale for not targeting the following:

- **There is a need to address social determinants that contribute to decreased state of health.**
  
  Houston Methodist is unable to focus on social determinants that include transportation, housing affordability, food security and other such factors due to competition for resources. Houston Methodist’s primary focus is to provide access to health care services. With recognition that the listed determinants can have an impact on one’s health status and overall quality of life, the hospital system is not equipped to address such determinants directly. However, the system will continue to support charitable partner facilities whose missions are focused on such initiatives.

- **There is a need to promote the importance of access to green space and parks within the surrounding community.**
  
  Houston Methodist is unable to focus on providing access to green space and parks due to competition for resources. Houston Methodist’s primary focus is to provide access to health care services. With recognition that access to green space and parks has the potential to increase levels of physical activity, and according to some studies have mental health benefits, the hospital system is unable to focus heavy resources on this proposed need. Houston Methodist will continue to work with charitable partners and the City of Houston in support of potential initiatives surrounding green space.

- **There is a need to address the unique health and social disparities within minority populations.**
  
  Houston Methodist is focused on addressing the health disparities that exist in our community. Through the prioritization of the previously listed needs, the impact that race and gender have on such disparities will be reviewed. In this appendix, readers can review a snapshot of health disparities specifically by race. This need will be addressed indirectly.
Checklist for ACA Compliance

To comply with proposed IRS regulations as set forth in IRS Notice 2011-52, a hospital must meet the following requirements with respect to a Community Health Needs Assessment (CHNA) written report and implementation strategy. In conducting the CHNA, Houston Methodist Sugar Land agrees that the following requirements were met and therefore the Hospital is in compliance with Affordable Care Act regulations:

- Describe the community served and how it was determined (e.g., geographic area served).
- Describe processes and methods used to conduct the CHNA.
- Describe the sources and dates of the data and other information used in the CHNA.
- Describe analytical methods applied to identify community health needs.
- Identify any information gaps that impact ability to assess the community’s health needs.
- List all organizations with which hospital collaborated in conducting CHNA.
- Describe how hospital took into account input from parties who represent broad interests of community served, input from person(s) with special knowledge of public health, input from federal, tribal, regional, state or local health departments and agencies, and input from leaders, representatives, or members of medically underserved, low-income, and minority populations in the community served by the hospital.
- Prioritized description of all of the community health needs identified through the CHNA and the process/criteria used in prioritizing such needs.
- Describe existing health care facilities and other resources within the community available to meet the community health needs identified through the CHNA.
- Identify names, titles, and/or affiliations of individuals consulted. Those consulted must include individuals with special knowledge of or expertise in public health, representatives, or members of medically underserved, low-income, and minority populations, and populations with chronic disease needs.
Development of the 2016 CHNA

Houston Methodist conducted its Community Health Needs Assessment (CHNA) and was able to prioritize the needs that each of its hospitals would address through a series of steps that included surveying patients located in each of the Houston Methodist service areas along with other techniques designed to uncover the most pressing concerns of the surrounding community.

**Phase 1: Community Feedback Collection**

- **Developing the Survey Questions:** The first step in developing the CHNA for Houston Methodist required the hospital system to first understand what mattered most to the population surrounding its eight hospitals in Greater Houston. To do this, the Office of Community Benefits worked with leaders in public health to develop and refine survey questions that would help Houston Methodist gain the first insight into the top social and health priorities of our city. The survey consisted of 25 questions and were divided under the categories of:
  + Tell Us About Yourself
  + Tell Us About Your Health
  + Tell Us About Your Community
  + Tell Us How You Feel

- **Distributing the Survey:** After the questions were developed for the survey, the surveys were then distributed electronically and in hard copy form across the community. Hard copy surveys were distributed to eleven (11) different facilities providing health care services to the uninsured and underserved population. These hard copy surveys were placed in the following facilities across Greater Houston:
  + Access Health
  + Christ Clinic
  + El Centro de Corazon
  + Hope Clinic
  + Krist Samaritan Counseling Center
  + Legacy Community Health
  + LIFE Houston
  + Northwest Assistance Ministries
  + The Rose
  + TOMAGWA Health Ministries
  + Vecino Health Centers

Additional hard copy surveys were distributed at Houston Methodist’s flagship location in the Texas Medical Center due to the variety of patients and guests who come to the location from more than eight counties. Electronic surveys were posted on various social networking sites to capture an uncontrolled group of respondents. Overall, more than 1,000 people were surveyed.

- **Survey results analyzed:** Surveyed facilities were given three months to collect responses from the client/patient base being serviced. Response collection began May 1, 2015 and ended August 15, 2015. Once all responses were collected, Houston Methodist contracted an external market analysis agency to conduct simple analysis of the data to lay the foundation for the assessment.
Phase 2: Community Leaders and Stakeholder Feedback

- **Selection of public health and community leaders with special knowledge including leaders and representatives of medically underserved, low-income, and minority populations and local, and state health agencies:** The Office of Community Benefits compiled a list of top health and community experts from around the Greater Houston community and state and shared key data uncovered by the community health needs survey. Experts and leaders were pulled from a variety of specialty areas including experts in the field of key health conditions from health care institutions including Houston Methodist. Also, experts were selected from key Federally Qualified Health Centers and Free/Charity Clinics such as but not limited to Legacy Community Health, The Rose, Access Health and Healthcare for the Homeless-Houston. Feedback was solicited from experts at public health education focused institutions such as the Kinder Institute for Urban Research at Rice University and UT School of Public Health as well as insight sought from city officials.

- **Selection of members of medically underserved, low income, and minority populations:** The Office of Community Benefits received the primary input on the needs of the underserved community through the distribution of a survey in which members were asked to answer a series of questions such as:
  
  + What are the 5 most important things that are needed for your city/community to be considered healthy?
  + What are the 5 biggest barriers that prevent friends and family from seeking medical treatment?
  + Tell us if you agree with the following statement: Treatment can help people with mental illness lead normal lives.
  + What are the top 3 things that you feel are negatively affecting your city/community?

The feedback from the underserved community served as the basis for interviews with community health leaders.

Phase 3: Methodology to Prioritize:

- **Statements of Need Formulated:** Interviews were conducted for each selected expert based off the survey findings in an effort to prioritize the needs and gain more detailed analysis of factors that may have contributed to respondents' answers. After the conclusion of the interviews over the course of 30 days, the Office of Community Benefits team reviewed and analyzed interviewee responses and formulated seven (7) Statements of Need. The basis for the formulation of the Statements were based on frequency of key words and phrases from interviewees along with how often interviewees agreed or disagreed with the survey respondents answers on key questions.

**Statements of Need:**

- There is a need to increase access to primary care services for the surrounding community.
- There is a need to address social determinants that contribute to decreased state of health.
- There is a need to reduce barriers to accessing specialty care services for the surrounding underserved community.
- There is a need to promote healthy living behaviors that reduce the likelihood of chronic disease development.
- There is a need to promote the importance of access to green space and parks within the surrounding community.
- There is a need to address the unique health and social disparities within minority populations.
- There is a need to increase access to mental health care services within the surrounding underserved community.
Statements of Need Prioritized: Once the seven (7) Statements of Need were formulated, stakeholders were approached approximately 30 days after the conclusion of the interview stint and asked to arrange the statements in order of importance, taking into consideration the following:

- Most Important
- Most Urgent
- Biggest Impact
- Furthest Reach

Based on the ranking order selected, a numeric value was assigned. The numeric opportunity ranked from a score of 1 to 7. The statements that were ranked higher in importance overall by stakeholders were selected as the umbrella for which the needs assessment would develop. The results of the prioritization done by public health experts and community stakeholders are illustrated below. Health issues will be expanded upon that are encompassed by the following prioritized health statements:

**Selected Priorities:**

- ✓ There is a need to increase access to primary care services for the surrounding community.
- ✓ There is a need to reduce barriers to accessing specialty care services for the surrounding underserved community.
- ✓ There is a need to increase access to mental health care services within the surrounding underserved community.
- ✓ There is a need to promote healthy living behaviors that reduce the likelihood of chronic disease development.

Though the other needs did not emerge as the leading priorities for Houston Methodist this community health needs assessment will still touch on them briefly later in the report. Houston Methodist recognizes each statement has value and can impact the community’s health and overall well-being.

**Phase 4: Secondary Data Collection**

- After priorities were selected, the Office of Community Benefits researched valid data sources to be used to support the prioritized Statements of Need and to supplement information collected from public health experts. A variety of sources were utilized including but not limited to, The U.S. Census, Texas Department of State Health Services (DSHS), The Center for Disease Control and Prevention, and the Houston Health Department. For a full list of data sources used in this report, please see the Appendix.
Community Input:

Input Collection: Input from person(s) with special knowledge

- Sara Schueneman, VP Development -- American Heart Association
- Sheena Roberts, CDO – American Cancer Society
- John Volpi, MD, Associate Professor of Clinical Neurology, Institute for Academic Medicine Assistant Member, Houston Methodist Research Institute – Houston Methodist Hospital
- David Chiu, MD, Elizabeth Blanton Wareing Chair in the Eddy Scurlock Stroke Center, Department of Neurology, Professor of Clinical Neurology, Institute for Academic Medicine, Associate Clinical Member, Houston Methodist Research Institute - Houston Methodist Hospital
- Miguel Quinones, MD, Chair, Houston Methodist DeBakey Cardiology Associates – Houston Methodist Hospital
- Anna Belcheva, MD, Houston Methodist Oncology Partners – Houston Methodist Willowbrook Hospital
- Abhishek Kansara, MD, Houston Methodist Academic Medicine Associates – Houston Methodist Hospital
- Abishek Kurrelmeyer, MD, Medical Director, Department of Cardiology, Houston Methodist DeBakey Cardiology Associates-Houston Methodist Hospital
- Julia Andrieni, MD, Vice President, Population Health, Houston Methodist Hospital

Input Collection: Input from federal, regional, state or local health departments/agencies

- Stephen Klineberg, Ph.D., MA - Kinder Institute of Urban Research
- Geoff Carleton, MBA, Principal- Traffic Engineers, Inc.
Racial and ethnic disparities in health care – whether in insurance coverage, access, or quality of care – are one of many factors producing inequalities in health status in the United States. Houston Methodist recognizes the importance of looking at all factors that can contribute higher mortality rates of its citizens. Below is a snapshot of the health status of the community by race with emphasis on Harris County due to it being the largest county in the state of Texas. The intention of this section is to provide an additional snapshot for community health providers interested in the unique disparities that each race may face and the impact that such disparities may have on the providers’ targeted service area.
### Employment Status by Race in Harris County (2014)
