LEADING MEDICINE

Clinical Manifestations

- Acute respiratory distress syndrome (ARDS)
- Hyper-inflammation ("cytokine storm")
- Acute cardiac injury, arrhythmias, cardiomyopathy
- Acute kidney injury
- Hypercoagulability, thromboembolic complications, pulmonary embolism
- Neurological complications

Disease Pathogenesis - SARS-COV-2

The viral spike protein uses the angiotensin-converting enzyme II (ACE2) receptor to enter epithelial cells. Alveolar cells lining lungs, GI tract, heart and kidney express ACE2 R and membrane TMPRSS2 serine protease cleave the viral spike protein and facilitate cell entry.

Neurologic Features in Severe SARS-CoV-2 Infection

TO THE EDITOR: We report the neurologic features in an observational series of 58 of 64 consecutive patients admitted to the hospital because of acute respiratory distress syndrome (ARDS) due to Covid-19. The patients received similar evaluations by intensivists in two intensive care units (ICUs) in Strasbourg, France, between March 3 and April 3, 2020.

Six patients were excluded because of para-

of nasopharyngeal samples were severe acute respiratory syndrome (SARS-CoV-2). The median age was 63 years, and the median Simplified Physiology Score II at the time examination was 52 (interquartile range 45-65, on a scale ranging from 0 to 100, with higher scores indicating greater severity). Seven patients had had previous

Summary

Background Concerns regarding potential neurological complications of COVID-19 are being increasingly reported, primarily in small series. Larger studies have been limited by both geography and specialty. Comprehensive characterisation of clinical syndromes is crucial to allow rational selection and evaluation of potential therapies. The current study reports the breadth of complications of COVID-19 across the UK that affected the brain.

How Does COVID-19 Affect The Nervous System

- Endothelial cells – ACE2 receptors to enter cells and membrane TMPRSS2 serine protease cleave the viral spike protein and facilitate cell entry – blood vessels
- Hypercoagulability, thromboembolic complications
- Virus is Neurotropic – Invasion of the CNS – Olfactory system via ACE2 receptor attachment and membrane TMPRSS2
- Hyper-inflammation – activated macrophages – “cytokine storm”
- Altered immune system – Post-infectious autoimmune disorders

Endothelial cell infection and endotheliitis in COVID-19

COVID-19 and its implications for thrombosis and anticoagulation

Jean M. Connors¹ and Jerrold H. Levy²⁻⁴

Summary of findings

- **Coagulopathy is manifest as elevated fibrinogen, elevated D-dimers, and minimal change in PT, aPTT, and platelet count in early stages of infection**
- **Increasing IL-6 levels are correlated with increasing fibrinogen levels – activated macrophages**

Large-Vessel Stroke as a Presenting Feature of Covid-19 in the Young

We report five cases of large-vessel stroke in patients younger than 50 years of age who presented to our health system in New York City. Severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) infection was diagnosed in all five patients.

Cough, headache, and chills lasting 1 week developed in a previously healthy 33-year-old woman (Patient 1) (Table 1). She then had progressive dysarthria with both numbness and weakness in the left arm and left leg over a period of 28 hours. She delayed seeking emergency care because of fear of Covid-19. When she presented to the hospital, the score on the National

2020, a total of five patients (including the aforementioned patient) who were younger than 50 years of age presented with new-onset symptoms of large-vessel ischemic stroke. All five patients tested positive for Covid-19. By comparison, every 2 weeks over the previous 12 months, our service has treated, on average, 0.73 patients younger than 50 years of age with large-vessel stroke.

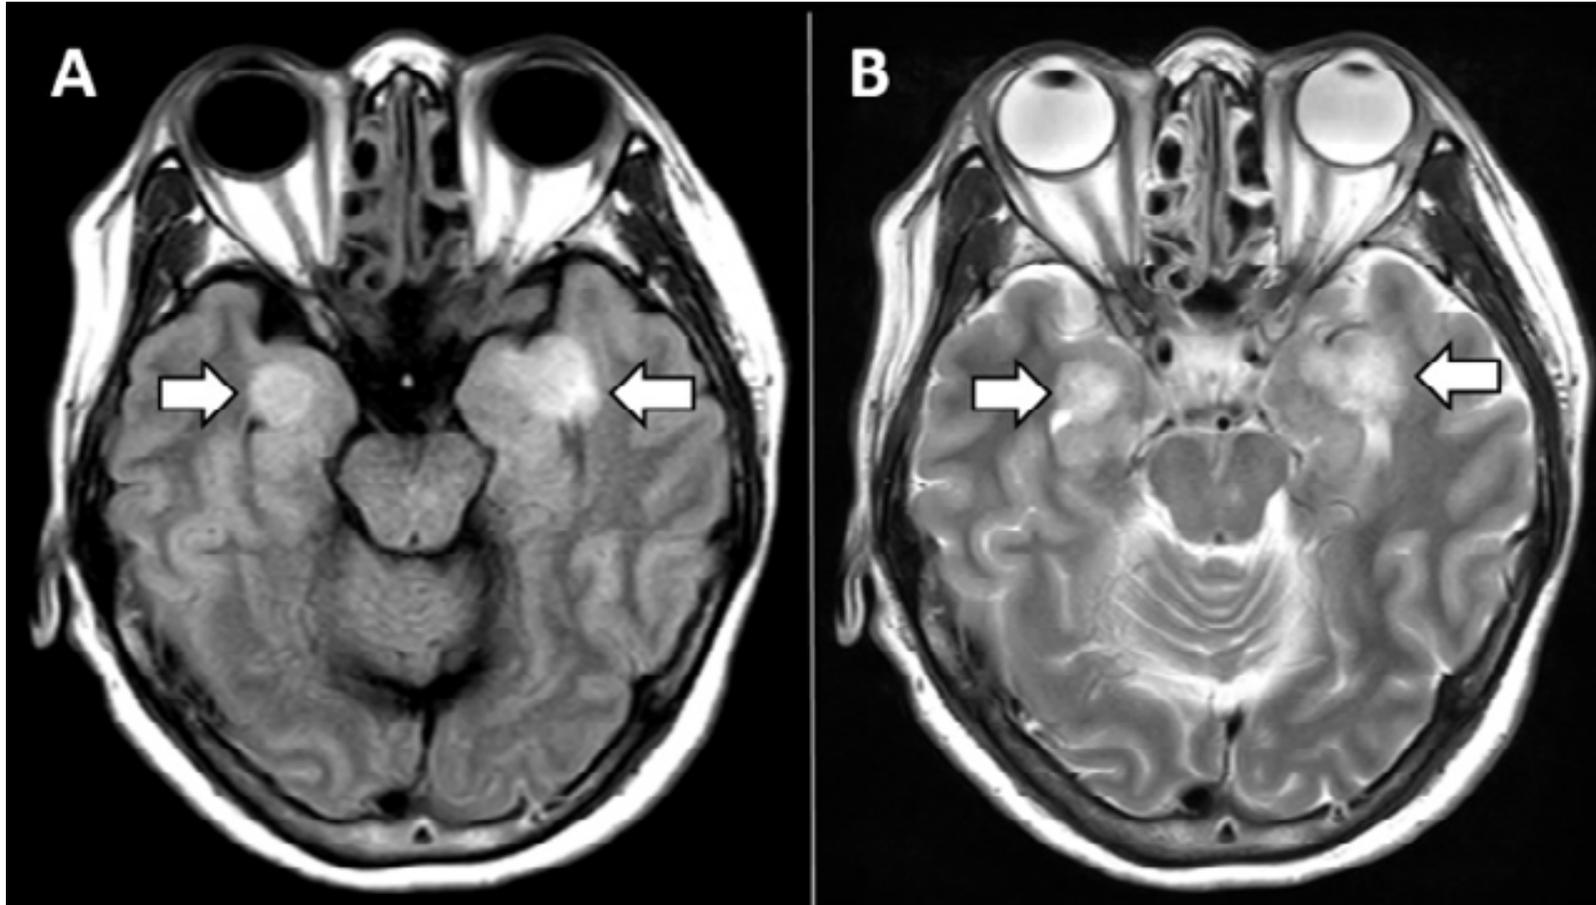

On admission of the five patients, the mean NIHSS score was 17, consistent with severe large-vessel stroke. One patient had a history of stroke. C

Non-neuronal expression of SARS-CoV-2 entry genes in the olfactory system suggests mechanisms underlying COVID-19-associated anosmia

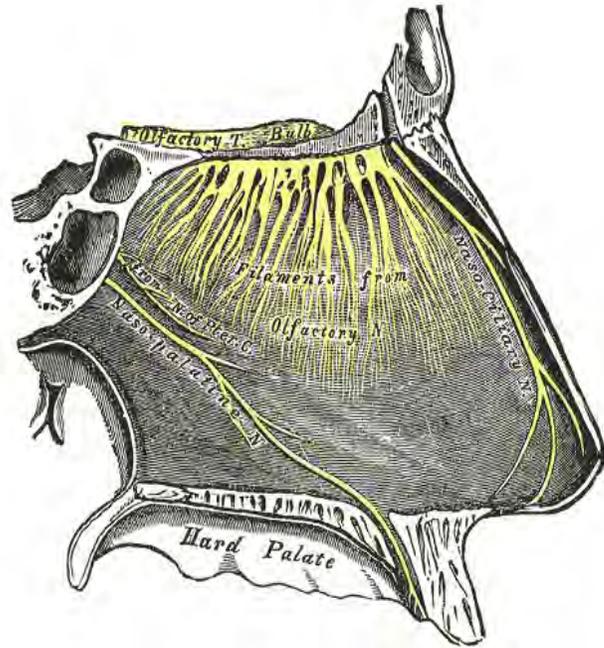

Bulk sequencing demonstrated that mouse, non-human primate and human olfactory mucosa expresses two key genes involved in CoV-2 entry, ACE2 and TMPRSS2. However, single cell sequencing revealed that ACE2 is expressed in support cells, stem cells, and perivascular cells, rather than in neurons. Immunostaining confirmed these results and revealed pervasive expression of ACE2 protein in dorsally-located olfactory epithelial sustentacular cells and olfactory bulb pericytes in the mouse. These findings suggest that CoV-2 infection of non-neuronal cell types leads to anosmia and related disturbances in odor perception in COVID-19 patients.

MEMORY

Goal: Develop a Biomimetic Model of Hippocampus to Serve as a Neural Prosthesis for Lost Cognitive/Memory Function

Strategy:

1. Biomimetic model/device that mimics signal processing function of hippocampal neurons/circuits
2. Implement model in VLSI for parallelism, rapid computational speed, and miniaturization
3. Multi-site electrode recording/stimulation arrays to interface biomimetic device with brain
4. Goal: to “bypass” damaged brain region with biomimetic cognitive function

Neuropace RNS

ORIGINAL ARTICLE

A Single-Center Experience with the NeuroPace RNS System: A Review of Techniques and Potential Problems

Brian Lee¹, Muhammad N. Zubair¹, Yvette D. Marquez², David M. Lee¹, Laura A. Kalayjian¹, Christianne N. Heck¹, Charles Y. Liu^{1,2}

INTRODUCTION: The clinical results for the RNS System (NeuroPace, Mountain View, California, USA) closed-loop responsive neurostimulator for the treatment of medically intractable partial-onset seizures have been encouraging. The University of Southern California (USC) Neurorestoration Center and the Keck Hospital of USC have become the world's first institutions to implant an RNS System post U.S. Food and Drug Administration (FDA) approval. As one of the study centers, we review our experience with our group of patients who have been implanted with the RNS System.

METHODS: A total of 40 surgeries by a single surgeon were performed on 10 patients (7 male and 3 female) with an average age of 39.2 years (24–66 years) and were followed for an average of 45 months (20–54 months). The average age at seizure onset was 14 years (birth–37 years) with an average of 4.7 (3–12) failed antiepileptic drugs. We reviewed the patients' charts for complications from the surgeries including infections requiring surgical intervention, hematomas, hardware failures, and death.

RESULTS: Of the 40 surgeries, there were 10 initial implantations of the neurostimulator and leads, 24 neurostimulator replacements for expected end of neurostimulator service, 2 incision and drainage procedures (I & Ds) for soft tissue infection followed by 1 explantation and 1 reimplantation (same patient), and 2 revisions because of one lead that was damaged at the exit point between the

skull and a titanium mesh and the second lead that was damaged at an acute bend over the skull (same patient). Eight of the patients had no complications and underwent an average of 2.7 neurostimulator replacements over 7 consecutive years to date. Each patient underwent routine postoperative computed tomography imaging of the brain, and none had any intracranial hematomas or misplaced leads requiring revision surgery. Finally, there were no deaths in our patient population.

CONCLUSIONS: Our experience with the NeuroPace RNS System over an average follow-up of 45 months suggests that the surgery and device are safe when placed by an experienced surgeon. Although there were no clinically significant hematomas or patient deaths, we did have 1 patient each with infection and lead damage at the point of exit from the skull. We compare the results of this study with other neurostimulation procedures for epilepsy to evaluate the safety and complications associated with the RNS System. Our initial experience suggests that the RNS System can be readily incorporated into an active epilepsy surgical center.

INTRODUCTION

For patients who suffer from medically refractory epilepsy, surgery is often explored as an option if they have a resectable lesion that can be identified as the focus of

COVID-19 Updates

H. Dirk Sostman, MD FACR

Town Hall October 14, 2020

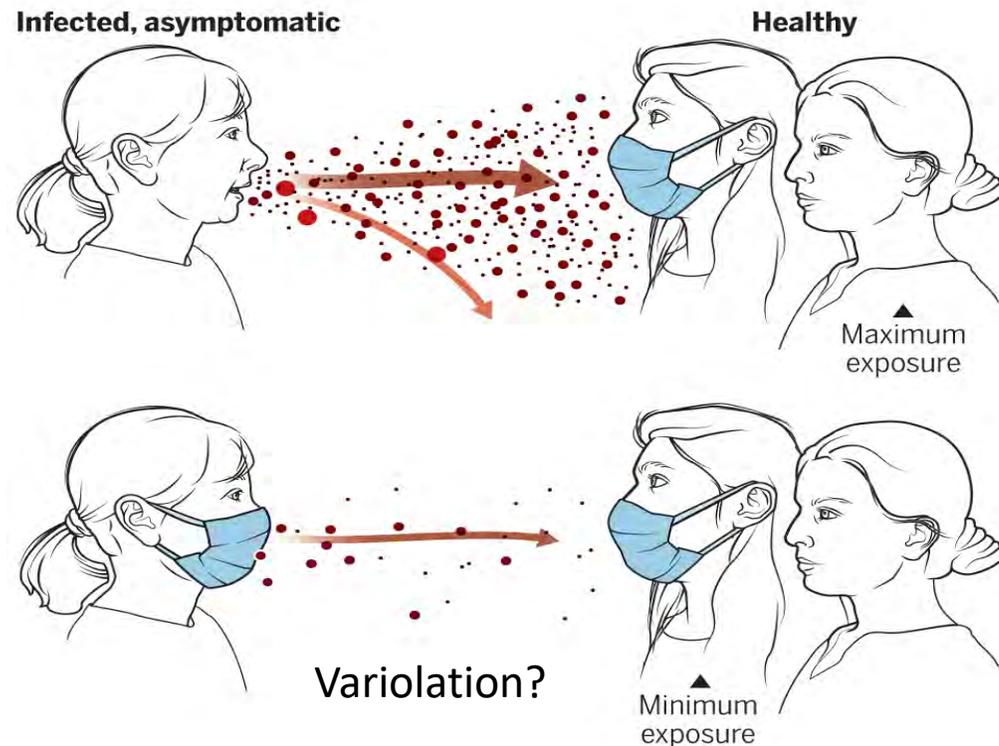

Controlling Infectious Diseases

Masks reduce airborne transmission

Infectious aerosol particles can be released during breathing and speaking by asymptomatic infected individuals. No masking maximizes exposure, whereas universal masking results in the least exposure.

Particle size (μm) 100 10 1 0.1 100 micron droplet settles in 5 sec
1 micron aerosol takes 12 hours

• Misconceptions

– Masks do not work

- Masks protect healthy people from infected people!
- Reduce egress / ingress of infected droplets and aerosols

– The virus is smaller than the pores in the mask

- Droplets are larger than pores
- Aerosols are trapped by other mechanisms

– Masks restrict oxygen supply

- Measurements show no effect on oxygen or carbon dioxide

– Masks are not needed with social distancing

- Wrong! Sneezes and coughs can travel 30 feet

– Masks are not needed outdoors

- The risks are lower outdoors but transmission still possible
- Use your judgement

Eye Protection

Can be helpful

- Viruses can enter the body through the eyes
- Dose usually low because of low air flow to the eyes
 - Ballistic droplets from a cough or sneeze are a high risk
 - In high risk situations like airplanes, eye protection is recommended
- Not a substitute for masks
 - Masks protect your nose and mouth
 - Eyewear protects your eyes

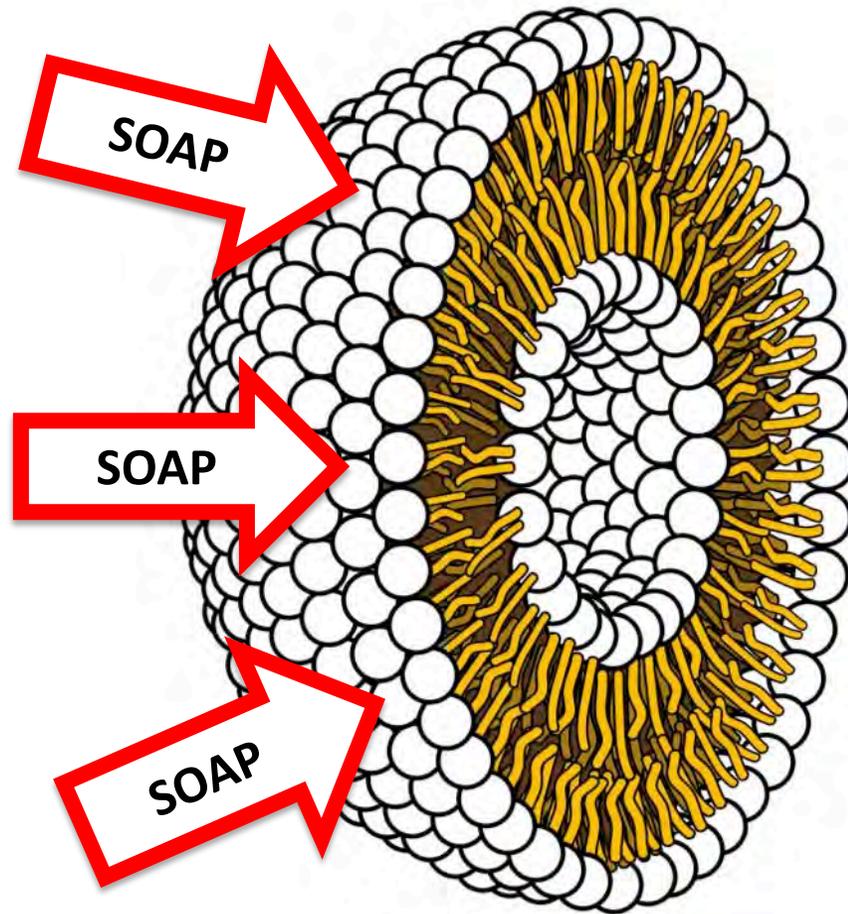

\$12 from Amazon

\$4 from Home Depot

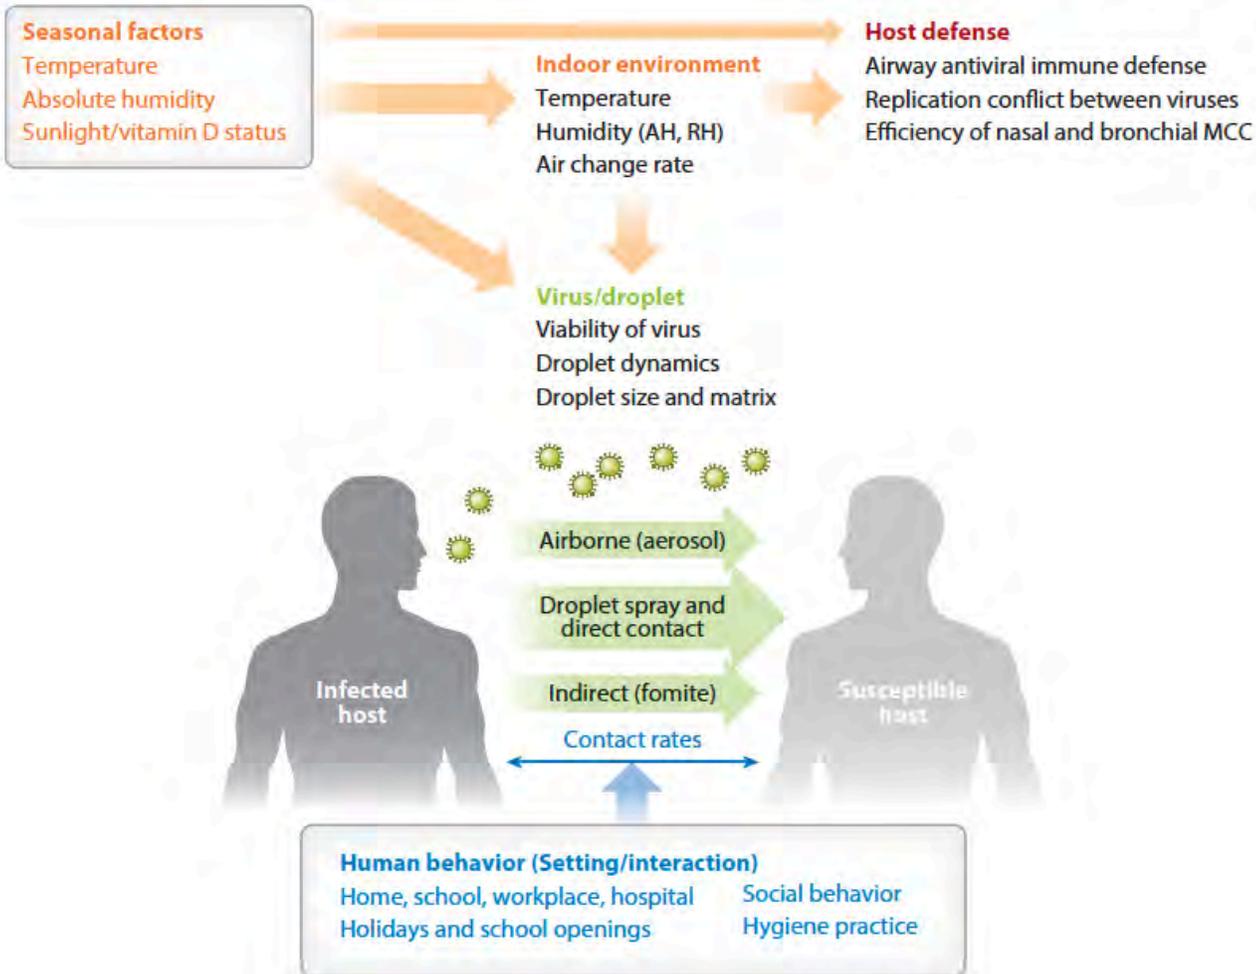

Handwashing

Your Mom was 100% correct

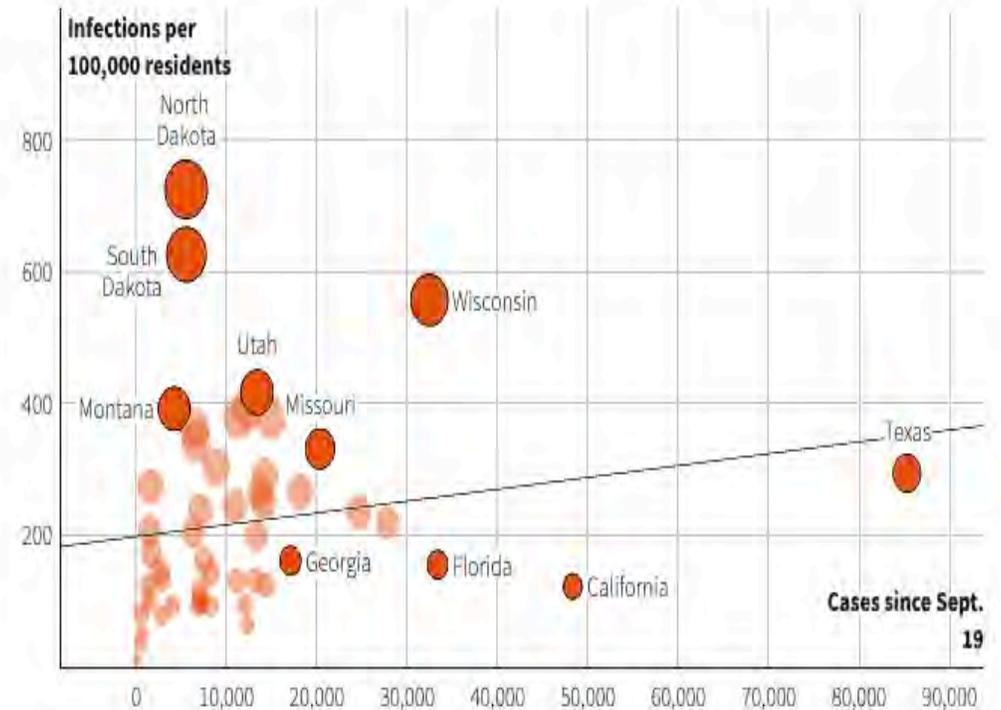

- Washing your hands with soap and water dissolves the lipid coating of the virus and inactivates it
- Alcohol-based sanitizer (60-95% alcohol) also works
- More effective to wash hands often than to try to disinfect packages, etc.

Respiratory Viruses Prosper in Winter

U.S. states with the biggest COVID-19 outbreaks

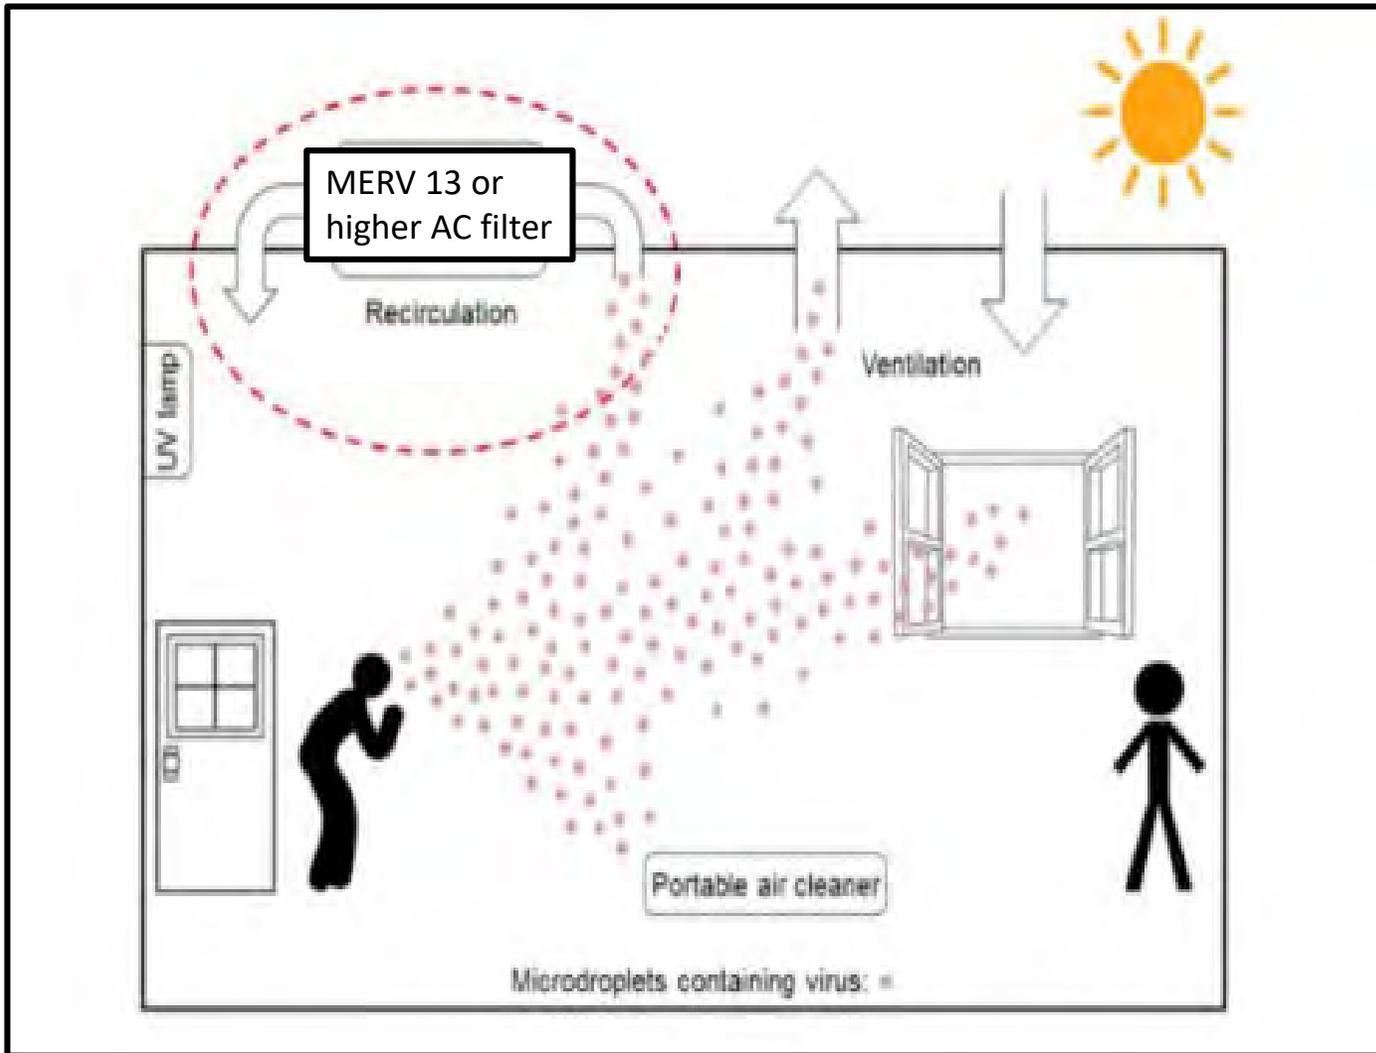

North Dakota leads the nation in new COVID-19 infections per capita the past two weeks followed by South Dakota and Wisconsin. New Hampshire, Vermont and Maine have the lowest rates.

Progress in Treatments for COVID-19

| Patient Group | “Proven” Effective (RCT or many cohort trials) | “Probably” Effective (still under investigation) |
|--|--|---|
| Outpatients | Remdesivir Convalescent plasma | Monoclonal antibodies Colchicine Favipiravir |
| Inpatients (including needing oxygen) | Remdesivir Convalescent plasma Baricitinib Steroids | Monoclonal antibodies Tocilizumab |
| Severely Ill (including mechanical ventilation & ECMO) | Steroids Remdesivir | Tocilizumab |

Regeneron Monoclonal Antibody Study for the Prevention of COVID-19

The purpose of this research study is to determine whether an experimental cocktail of two antibodies can prevent progression of asymptomatic COVID-19 to symptomatic COVID-19. Samples will be taken from the back of the nose to determine how much virus is in the body at various times during the study. Participation could last about 12 weeks and includes one in-person visit for treatment at Houston Methodist Hospital, with possible follow-up visits in person, at home or on the phone.

What is the 'monoclonal antibody cocktail'?

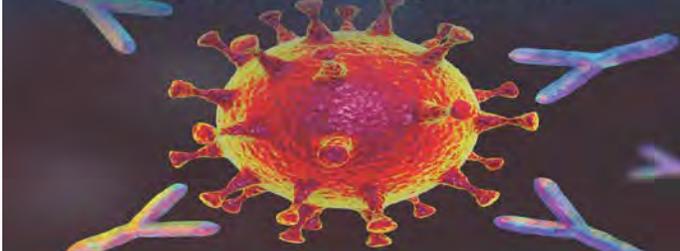

This cocktail from Regeneron contains two neutralizing monoclonal antibodies (mAb) called REGN10933 and REGN10987 that bind to key sites on the virus to prevent it from getting into human cells.

Things to know:

- Eligible volunteers must:
 - Have a positive COVID 19 test less than 3 days prior to participation, AND
 - Not require supplemental oxygen, AND
 - Not have been hospitalized for COVID 19
- You will be in the study for 29 days, and required to complete in-person visits.
- The study drug must be administered within three days of positive confirmation of SARS-CoV-2 infection.

For more information, call 713.441.3250.

Lilly BLAZE-1 Study for the Prevention of COVID-19 Progression

The purpose of this study is to measure how well LY3819253 works against the virus that causes COVID-19. LY3819253 will be given to participants with early symptoms of COVID-19, via an IV infusion. Samples will be taken from the back of the nose to determine how much virus is in the body at various times during the study. Participation could last about 12 weeks and includes one required visit to the study site, with the remainder of assessments performed in the home or by phone.

What is LY3819253?

LY3819253 is a potent, neutralizing monoclonal antibody (mAb) that binds to the spike protein of SARS-CoV-2. It blocks the virus from getting into human cells.

Things to know:

- Time commitment is minimal, with limited in-person and follow-up appointments.
- The study drug must be administered within three days of positive confirmation of SARS-CoV-2 infection.

For more information, call 832.993.4800.

Convalescent Plasma Therapy

Houston Methodist Clinical Trials Overview

| | Contact | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
|-----------------------------------|--------------|----------------------------|---|---|---|---------|--|-----------|----------|------|
| | | Asymptomatic Outpatient | | | Hospitalized | O2 Supp | NIV or High Flow | Mech Vent | Pressors | ECMO |
| <u>PYAB-BLAZE-1</u> | 281-414-3988 | | | | | | | | | |
| <u>AT527</u> (Age 45-80, Sx <5d) | 713-441-3247 | | | | O2 Sat > 93% on RA or <2 L O2 | | | | | |
| <u>CLAZA</u> (PCR<72h) | 281-414-9916 | | | | CRP≥3.5 | | | | | |
| <u>FAVI</u> (Age 18-80, PCR <7d) | 281-900-7330 | | | | Oral, no co-infxn or immunosuppression | | | | | |
| <u>ACTT-3</u> | 281-900-7330 | | | | IV RDV +/-SQ interferon beta-1a | | | | | |
| <u>iMAB</u> (PCR anytime) | 281-900-7330 | | | | SOC with RDV, steroids, etc. allowed | | | | | |
| <u>REGENERON</u> (Sx <10d) | 281-900-7330 | | | | SOC with RDV, steroids, etc. allowed | | | | | |
| <u>TOCI/ANKK/INFLX</u> (PCR <=7d) | | | | | combination therapy; no co-infxn; LFTs ≤ 3x ULN | | | | | |

VACCINE UPDATE

HOUSTON
MethodistSM
LEADING MEDICINE

Vaccine Progress – Immune Responses

| Vaccine | Antibody Response | T Cell Response | Species | N of Doses | Protection (Monkeys) | EUA Target |
|--------------------------|-----------------------|--------------------|---------|------------|----------------------|--|
| Moderna | 100% (2x – 8x CP) | 100% | Human | 2 | Infection | December 2020 |
| Pfizer / BioNTech | 100% (5x – 30x CP) | 94% | Human | 2 | | October 2020 |
| J & J | 100% | 82% | Human | 1 | Infection | Q1 2021 PAUSED |
| Oxford / Astra Zeneca | 100% (= CP) | 100% | Human | 2 | Disease | September 2020 PAUSED in USA |
| Novavax | 100% (2x CP) | 100% (subgroup) | Human | 2 | | December 2020 |
| Inovio (MERS) | 94% | 71% | Human | 3 | | ?? |

CP = convalescent plasma

Other Vaccine Challenges

- Reluctance to accept vaccination
 - Politics, concern about side effects
- Logistics Challenges
 - Supplies (borosilicate glass vials, etc.)
 - Cold chain of refrigeration
 - Air freight capacity (8,000 jumbo jets)
 - Paperwork, customs, health regulations, etc.
 - Organizing administration, records, etc.
 - Monitoring safety, side effects

GOOD

- Scenario 1 (15%)
 - Vaccine 80%–90% effective, minor side effects
 - EUA in Q4 2020
 - Widespread vaccination in Q1 & Q2 2021
 - Would control pandemic severity
- Scenario 2 (70%)
 - Vaccine 60%–70% effective, minor side effects
 - EUA in Q4 2020
 - Widespread vaccination in Q1–Q3 2021
 - Best if paired with testing, treatment, precautions
 - Will COVID-19 eventually become milder, seasonal illness?

NOT GOOD

- Scenario 3 (10%)
 - Vaccine < 50% effective
 - Need to wait for next generation of vaccines (6-12 months)
 - Need to rely on testing, treatment, precautions
- Scenario 4 (< 5%)
 - Vaccine has serious side effects
 - Need to wait for next generation of vaccines (> 1 year)
 - Safety testing will take **much** longer
 - Need to rely on testing, treatment, precautions

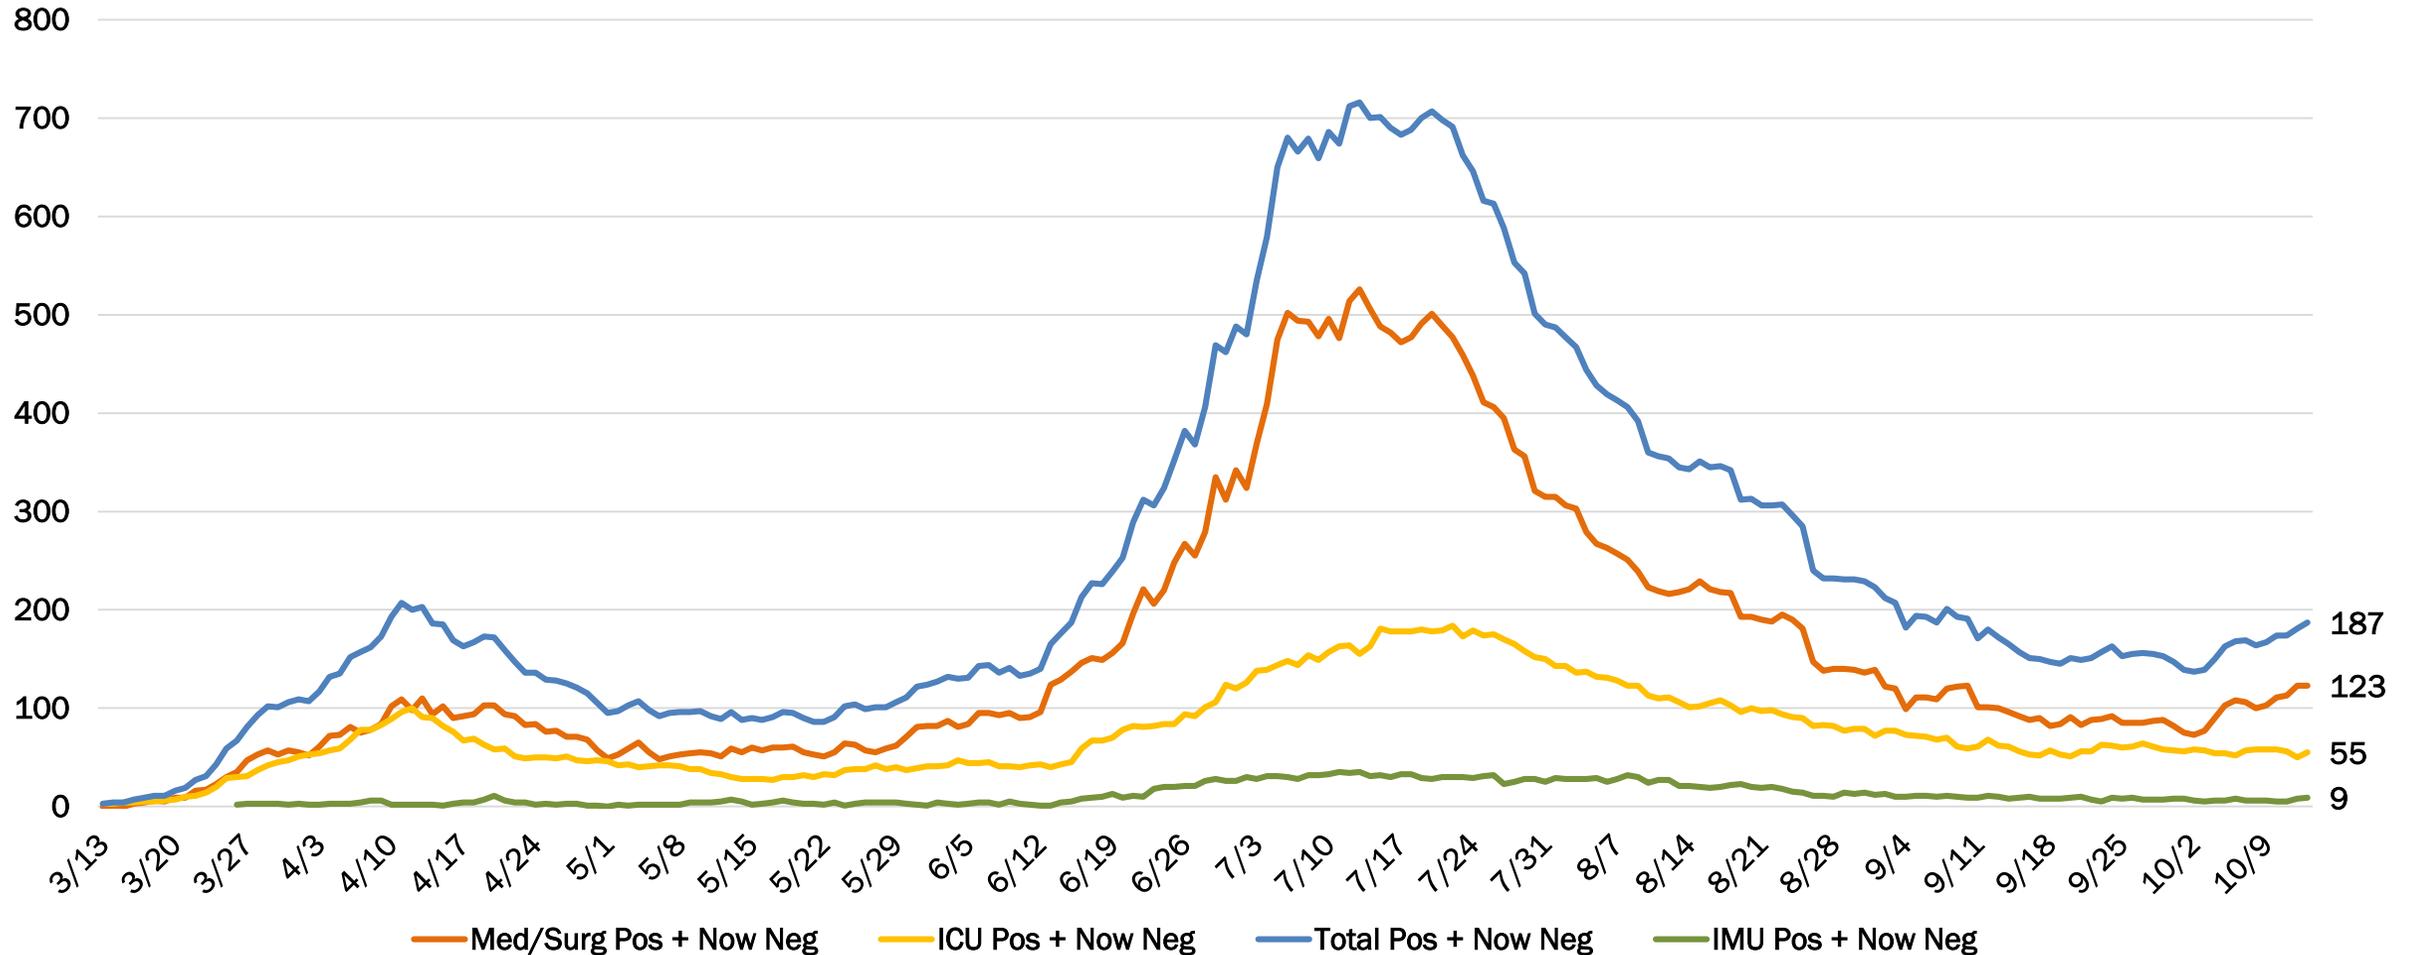

COVID-19 Update

October 14, 2020

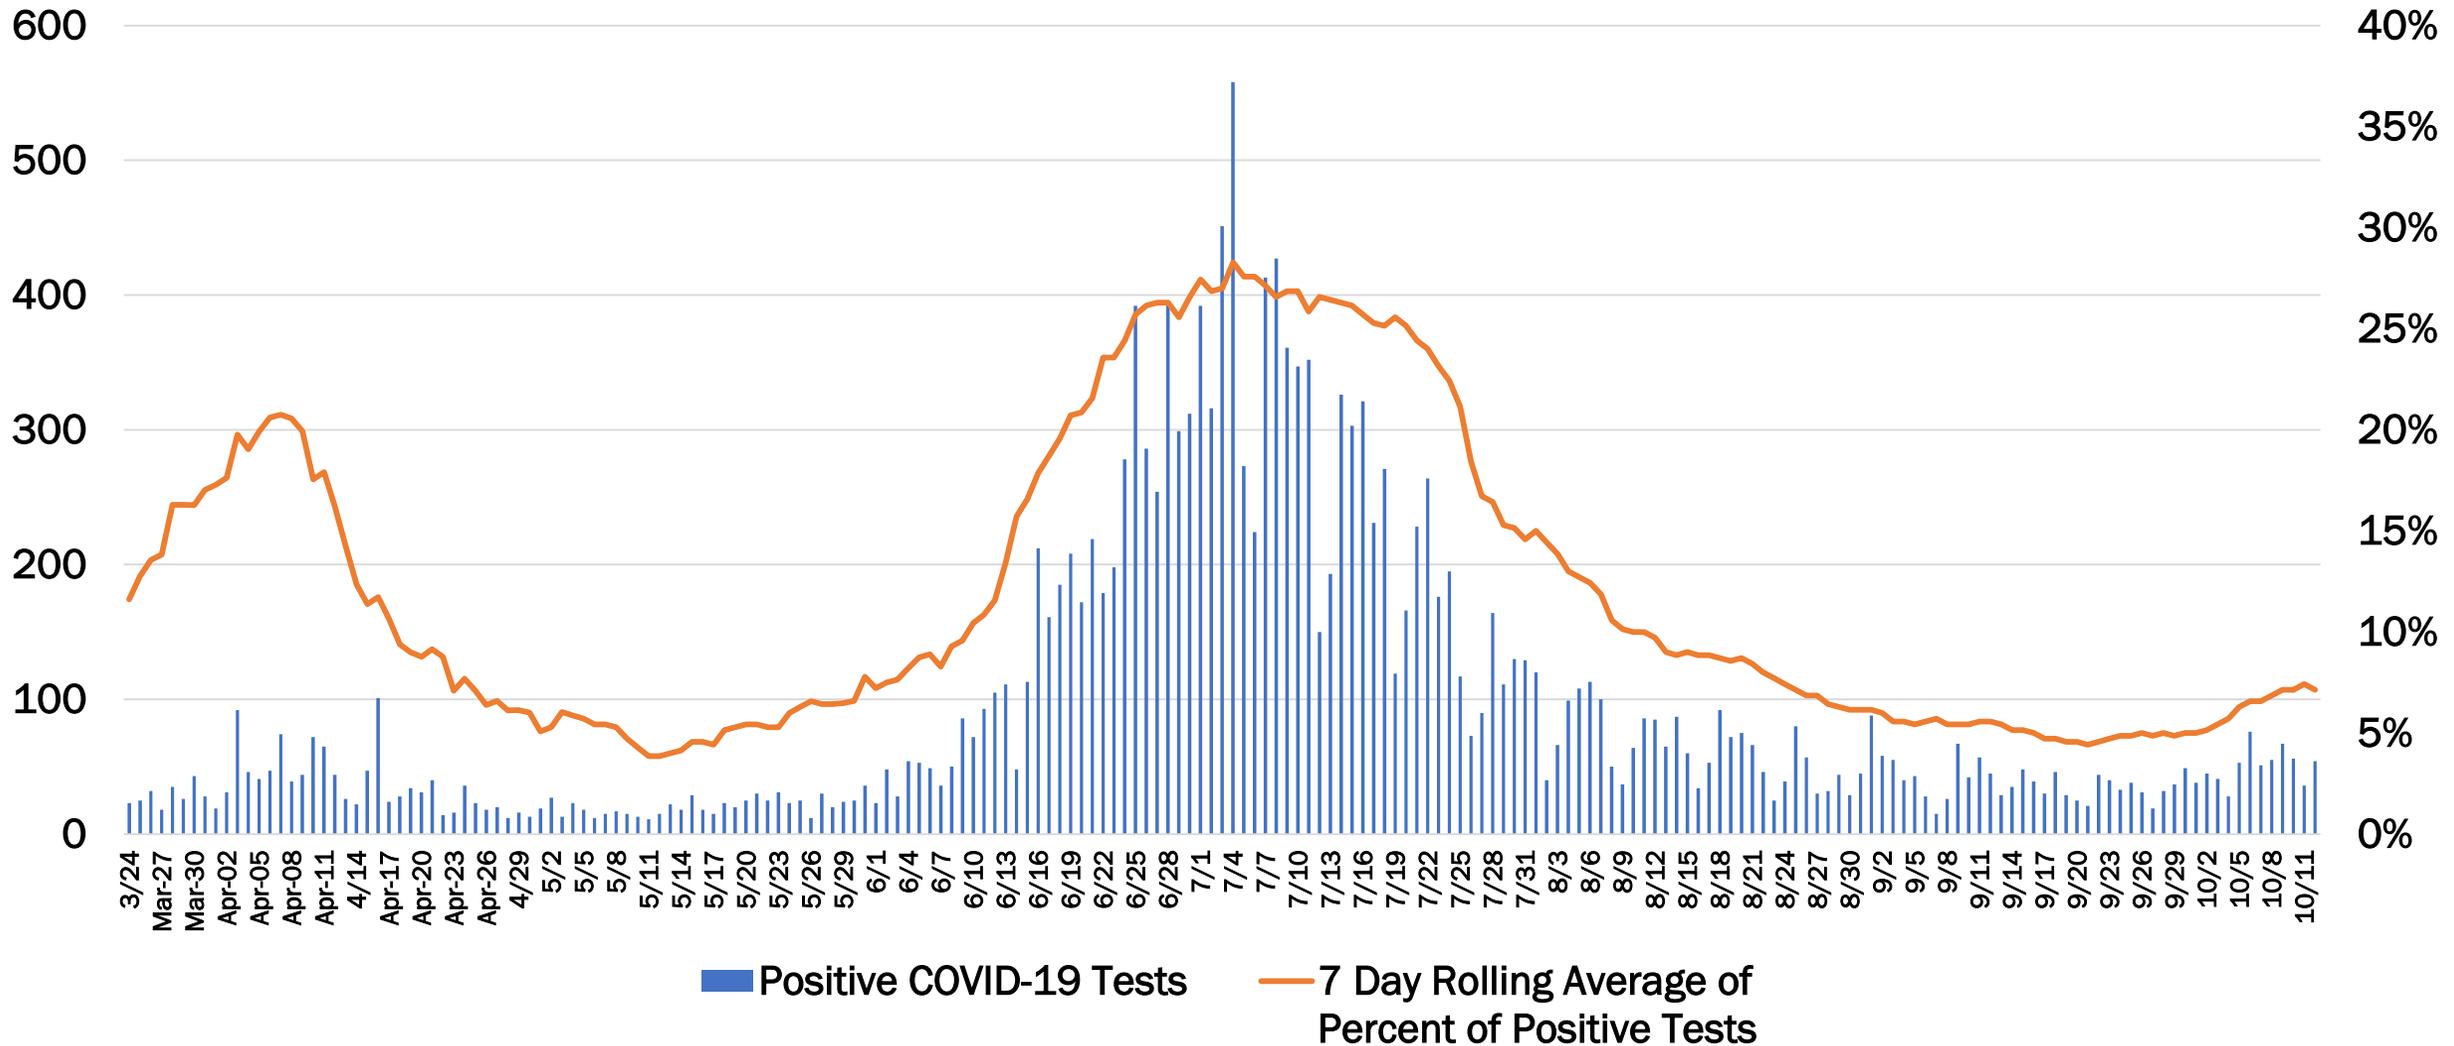

Houston Methodist COVID-19 Cases by Day

Houston Methodist COVID-19 Patients by Day

Houston Methodist Testing Trend

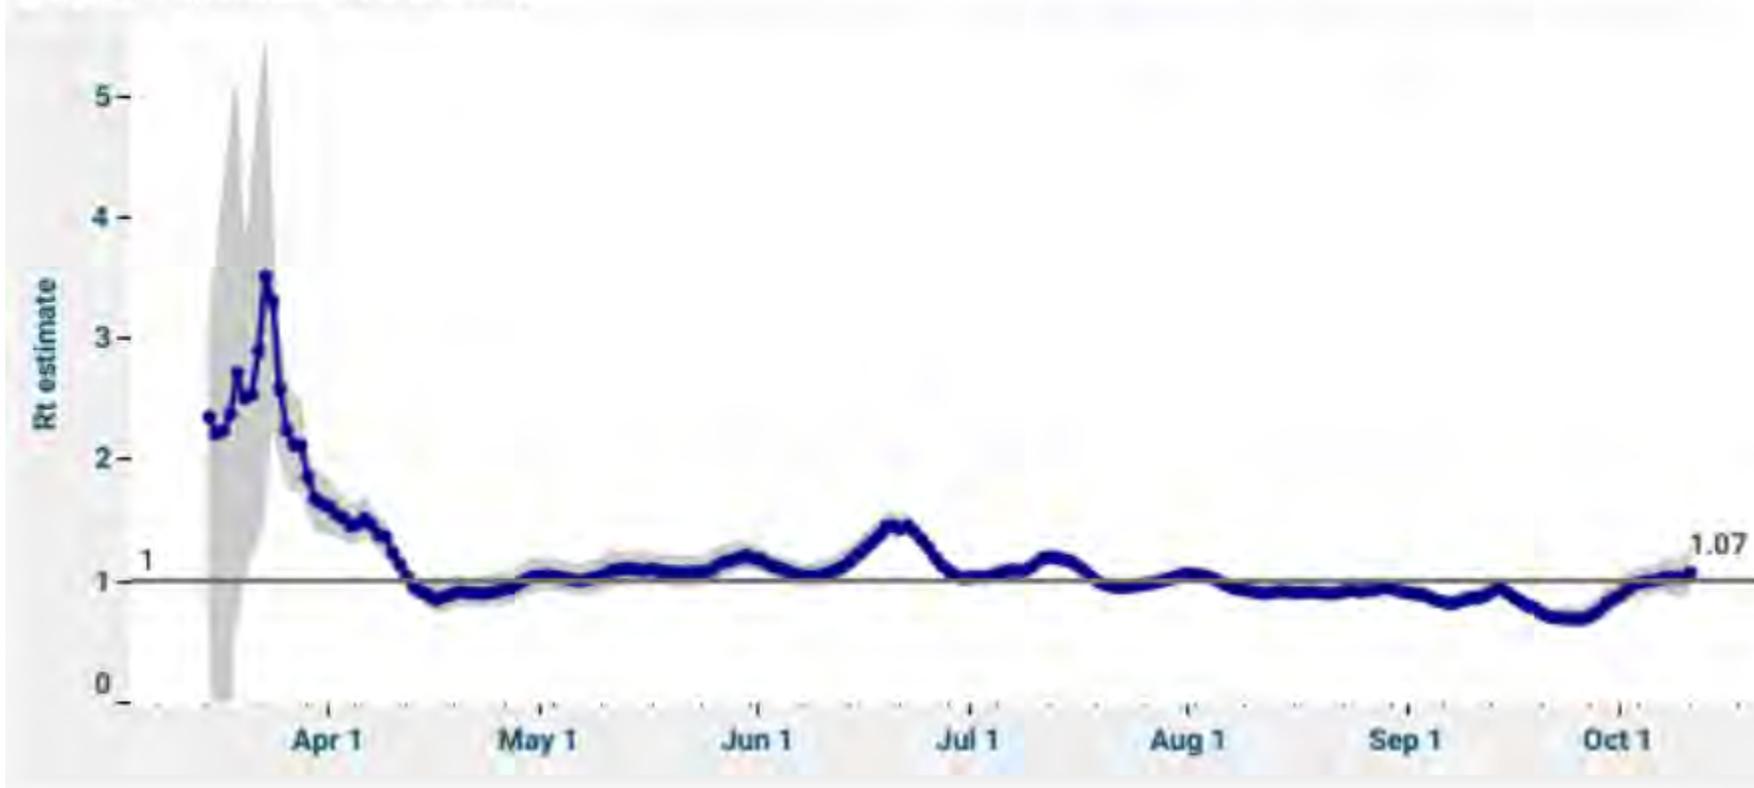

Confirmed COVID-19 Lab Tests

Houston Area Rt Estimate Trend

Rt estimate

This graph shows the $R(t)$ over time. $R(t)$ is a measure of contagiousness or how many people one COVID19 person infects. If $R(t) > 1$, the epidemic is increasing. If $R(t) < 1$, the epidemic is declining. There is higher alert if the whole interval is above the horizontal line at 1. For **Q - Houston**, the rate of contagiousness is **1.07**; the epidemic is **increasing**.

HOW LONG DO YOU ANTICIPATE US NEEDING TO
CONTINUE WITH MITIGATING ACTIVITIES FOR COVID-19
AND WHAT IS THE PROBABILITY FOR ANOTHER PANDEMIC
IN THE NEAR- TO MID-TERM FUTURE?

WHEN WILL LIFE BE TOTALLY BACK TO NORMAL OR WILL
IT EVER BE ?

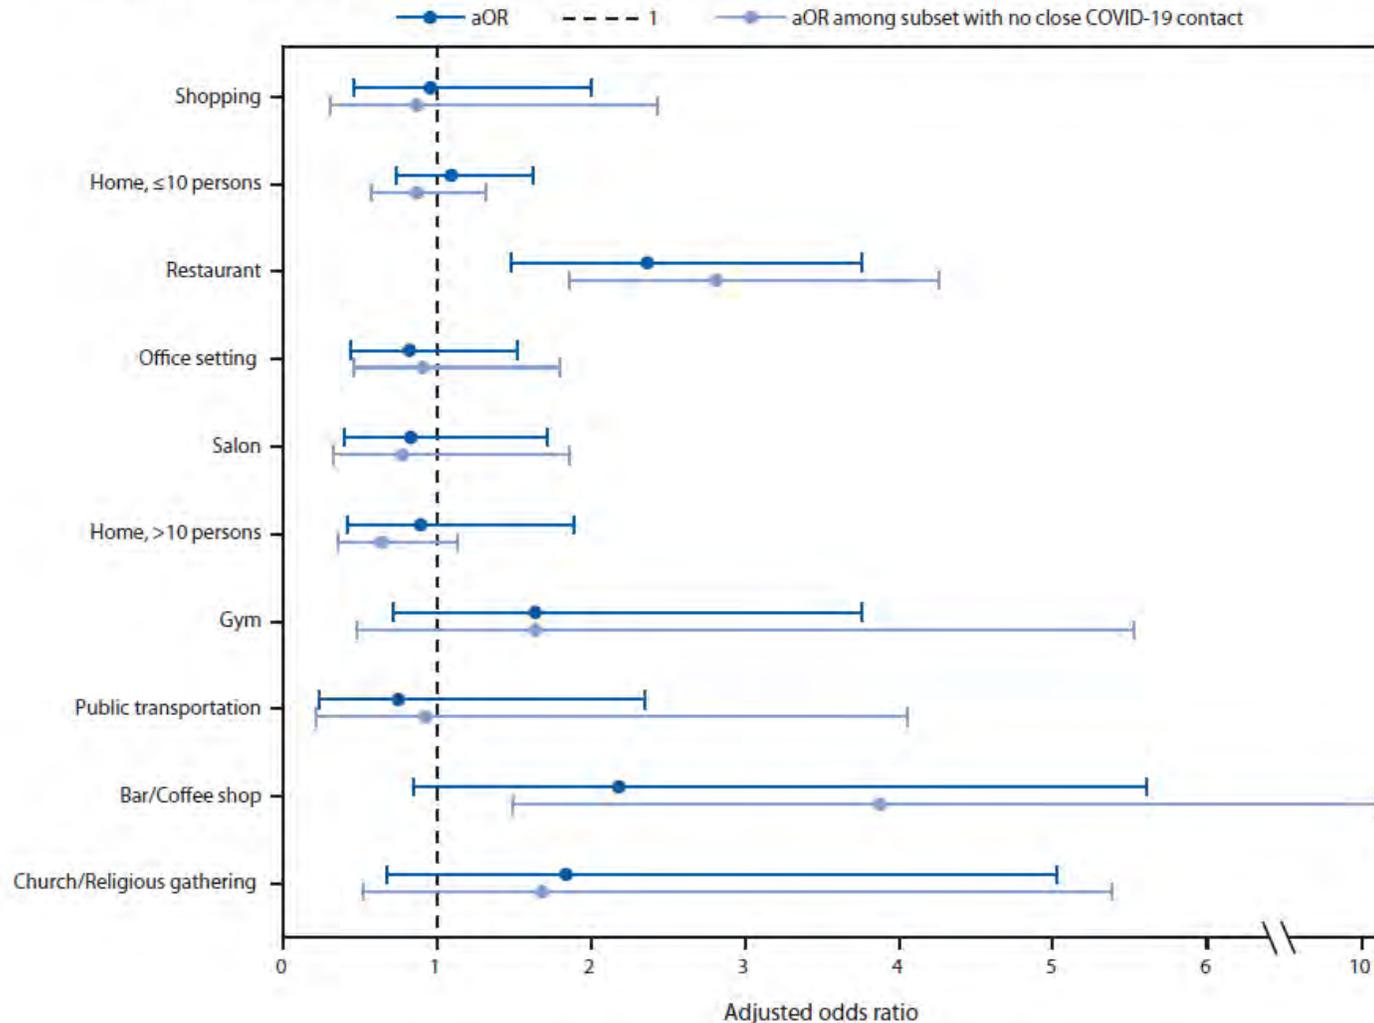

WHEN IS IT SAFE TO COME OUT AGAIN?

NOW THAT THE COVID SITUATION IN HOUSTON IS IMPROVING, WHAT ADVICE DO YOU HAVE ON HOW WE SHOULD CONTINUE TO LIVE? FOR EXAMPLE, FOR SOMEONE BETWEEN 45-55 YEARS OLD, IS IT NOW RELATIVELY SAFE TO EAT OUTDOORS AT A RESTAURANT? AT A FRIEND'S HOUSE? IF NOT, WHEN WOULD YOU CONSIDER IT TO BE SAFE?

IF SOMEONE IS EATING OUTSIDE AT A RESTAURANT IN CLOSE PROXIMITY TO SOMEONE WHO HAD COVID FOR TWO DAYS AND NOW HAS NO SYMPTOMS AND IS NOT QUARANTINING, AND HAS DECIDED TO GO OUT TO EAT, WHAT ARE THE CHANCES OF THE NON-INFECTED PERSON GETTING COVID FROM THE PERSON WHO HAS NOT QUARANTINED FOR THE PROPER DURATION?

Close Contact Exposures Associated with COVID-19

FIGURE. Adjusted odds ratio (aOR)* and 95% confidence intervals for community exposures† associated with confirmed COVID-19 among symptomatic adults aged ≥18 years (N = 314) — United States, July 1–29, 2020

“...going to locations that offer on-site eating and drinking options were associated with COVID-19 positivity. Adults with positive test results were approximately twice as likely to have reported dining at a restaurant than were those with negative test results.”

ALSO, WE PASS PEOPLE CLOSELY ON THE STREET WHEN WALKING OUR DOG. IS THAT OK WITHOUT A MASK?

Make trick-or-treating safer

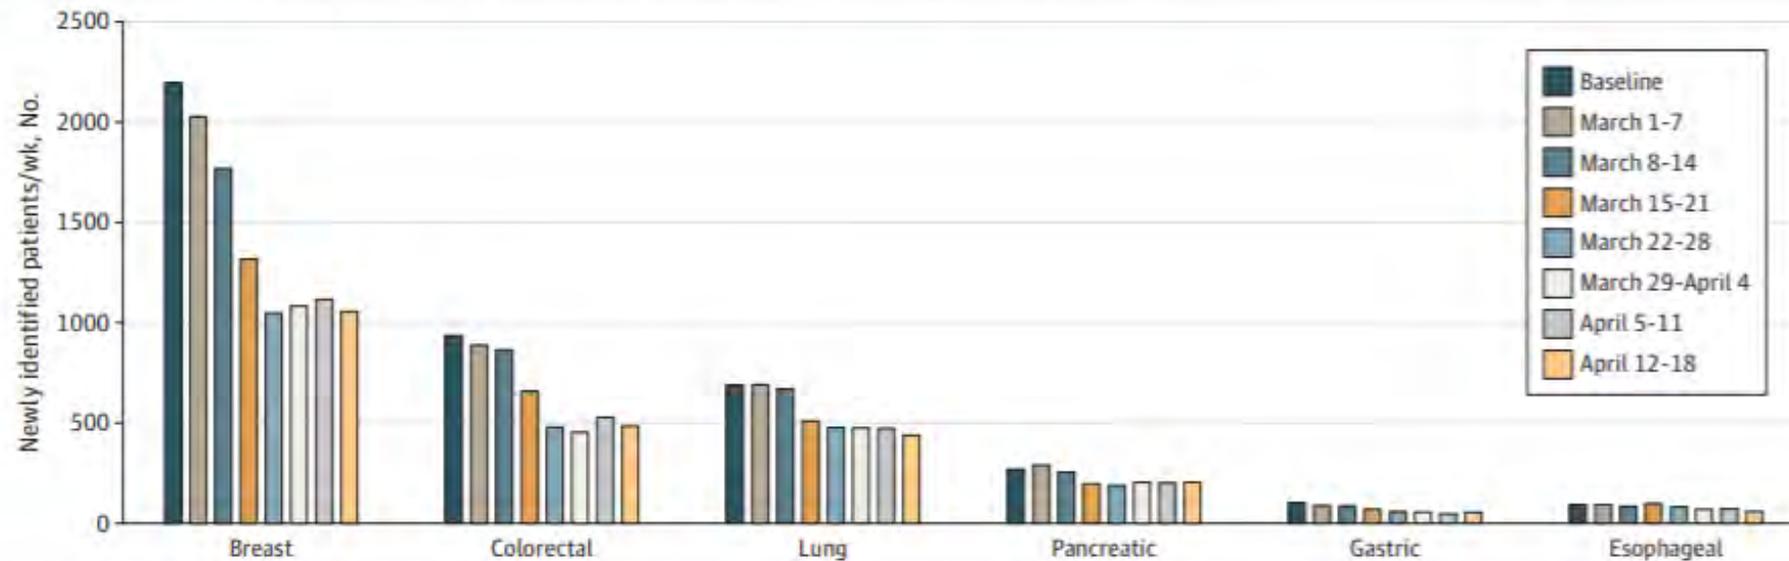

- Avoid direct contact with trick-or-treaters.
- Give out treats outdoors, if possible.
- Set up a station with individually bagged treats for kids to take.
- Wash hands before handling treats.
- Wear a mask.

IS AN ENDOSCOPY SAFE? I DON'T WANT TO TAKE MY MASK OFF. HOW DO I KNOW IT ISN'T IN THE AIR IN THE PROCEDURE ROOM?

Delay and Avoidance of Preventive and Screening Medical Care

Figure. Newly Identified Cancers, Baseline Mean and Weekly During the Coronavirus Disease 2019 Pandemic

“...the mean weekly number of new diagnoses for six common cancers dropped by 46%, with breast cancer diagnoses declining the most (52%), in March and April compared to the two months prior.”

HOW IS HOUSTON METHODIST DOING?

Goals for the New Normal – May

1. Houston Methodist will be the safest hospital system in the world
2. Volumes will be back to normal by July 1
3. Achieve at least breakeven by the end of the year
4. Maintain full operations during a second surge
5. Avoid furloughs, layoffs, and pay cuts

These goals will be the guiding principles for ongoing decision making during this transition to the new normal. We will continue to adjust these goals as circumstances change.

Goals for the New Normal – May

1. Houston Methodist will be the safest hospital system in the world
2. Volumes will be back to normal by July 1
3. Achieve at least breakeven by the end of the year
4. Maintain full operations during a second surge
5. Avoid furloughs, layoffs, and pay cuts

These goals will be the guiding principles for ongoing decision making during this transition to the new normal. We will continue to adjust these goals as circumstances change.

Goals for the Remainder of 2020

1. Houston Methodist will be the safest hospital system in the world
2. Volumes will again be back to normal by October 1
3. We will achieve ~75% of budgeted operating margin for September – December
4. Maintain full operations throughout the COVID pandemic
5. Press our strategic advantage

Houston Methodist will use these guiding principles in decision making and goal setting. We will remain nimble and adjust these goals as circumstances change.

Press Our Strategic Advantage

1. Focus on unparalleled safety, quality, service and innovation

U.S. News & World Report

- On the Honor Roll – Ranked #20 in the country
- Houston Methodist Hospital is ranked for the 28th consecutive year in at least one specialty
- Named No. 1 in Texas nine years in a row
- Received “High Performing” in 10 out of 10 of the procedures & conditions
- For the 14th consecutive year, Houston Methodist Hospital ranked in more specialties than any hospital in Texas
- Ranked in 11 of 16 specialties:
 - Cancer (#17)
 - Cardiology & Heart Surgery (#12)
 - Diabetes & Endocrinology (#28)
 - Ear, Nose & Throat (#49)
 - Gastroenterology & GI Surgery (#14)
 - Geriatrics (#26)
 - Gynecology (#26) *tied with UCLA*
 - Nephrology (#19) *tied with Duke*
 - Neurology & Neurosurgery (#23)
 - Orthopedics (#13)
 - Pulmonology and Lung Surgery (#20)

Unparalleled Safety and Quality

Vizient Quality & Accountability Results 2020

| | Academic | | Specialized Complex Care | Complex Care | | | Community |
|-----------------------------|----------|----------|--------------------------|--------------|----------|----------|-----------|
